Welcome to Project Octahedron!

One annotation round = one prompt message

Start annotation → send one prompt → review both model responses → grade.

Do not send follow-ups or additional messages within the round, even if the model has not completed the goal. If a model asks a clarifying question or leaves the goal unfinished, score what it actually produced from your one prompt, with the usual rubric.

IMPORTANT: Hatch's on-platform guidelines may still contain different or older instructions. **DO NOT FOLLOW HATCH GUIDANCE THAT ASKS YOU TO SEND MULTIPLE MESSAGES, ADD FOLLOW-UPS, OR CONTINUE UNTIL THE GOAL IS COMPLETE.** Follow this project's one-message rule above. The rest of Hatch's instructions still apply.

🎯 **The whole job in one sentence**

You **pretend to be a person**, you **ask their AI assistant for help**, the assistant **answers you twice in two different ways**, and you **decide which answer is better** - and explain why.

What makes an answer "better" here is mostly **how it talks to you**: does it sound like a real, thoughtful companion, or like a robotic AI bot? (In industry terms, this is an **AI agent evaluation** project.)

Picture one task, step by step

1. You become someone else

Hatch (the customer's tool) gives you a pretend person, called a **persona**. They have a whole digital life: emails, a calendar, text messages, notes, health data and more. That world is called their **universe**. None of it is real, but all of it is there to read.

2. You look around their life first

Before you ask anything, open the **Apps** tab and read. Who are their friends and family? What is on their calendar this week? What have they been texting

about? What might they need help with?

3. You write to their assistant, as them

Write a message the way *that person* would, about something that **really exists in their world**. For example, you notice a late flight on Thursday and a dinner with a friend the same evening, so you write: *"my flight thursday lands late, can i still make dinner w priya?"* This first message is called the **task prompt**. You write it in HAI first, and it must pass HAI's automatic checks before you use it in Hatch. Never invent things that are not in their world.

4. The assistant answers you twice

Your message goes to **two versions** of the assistant at the same time, called **Arm A** and **Arm B**. Each one writes its own reply. You are not told which AI model is behind each arm - do not try to guess. This one message is the whole round: send no follow-ups, even if a reply asks you something or is unfinished. It goes to both arms word for word the same.

5. You decide which reply is better

Read both replies in full. Ask yourself: which one would I rather get, if I were this person? Look mostly at **how it is written** - the voice, the tone, the warmth, how clear and well built it is. Also check that what it says and does is true in the person's world: if it says "I moved your meeting", look in the calendar. Sounding confident is not the same as being correct.

6. You score it and explain why

You record three things:

- **Eight dimension scores** - eight separate questions, each comparing A and B on one thing (for example Tone, or Correctness). Each score goes from **1 = A significantly better**, through **3 = Tie**, to **5 = B significantly better**. Pick Tie when neither reply has a meaningful advantage on that one thing - it does not have to be worded identically, just equally good or equally weak there.
- **One Preference** - your overall pick: which reply you would rather get. It is your own judgement, not an average of the eight scores. Score the eight dimensions first, then choose it.
- **One Required rationale** - a few sentences that name the *concrete* difference, such as a line, the tone, or a detail one reply got wrong. Someone who never saw the replies should understand your choice.
- **One Absolute quality** - how good the reply you preferred is on its own: **Perfect**, **Good** or **Bad**.

Your scores, Preference, Absolute quality and rationale must all tell the same story. The rationale is always written in English.

7. You submit and get paid

You use two systems. **HAI** (Handshake AI) holds your task, your prompt, your scores, the quality checks and your pay. **Hatch** is where the conversation with the two arms happens. So: start the task in HAI (this starts your paid time), have the conversation in Hatch, then go back to HAI to submit. The exact clicks, in order, are on **How a task works**.

🌐 Language tasks: four extra rules

This guide is multilingual for every locale, including English India. Your task form tells you the language, the universe and **your protocol for this task: Hatch RM Style Task — Multilingual v1**. Do not choose Hatch RM Style Task (without Multilingual), Preference-Derived RL rubrics, or Avocado. Everything else in this guide still applies. On top of it:

1. Pick your locale's universe. Each task lists the 8 or 9 universes of your locale, personas who live in your country. Choose one of them, searching by language **and** country, and keep that same universe for your later sessions. In Hatch's universe picker, type your locale code (for example `fr_ca`, `hi_in_dl` or `ta_sg`) to see only your locale's universes. Never use a universe from another locale, even in the same language: `ta_in_tn` is not `ta_sg`. Chinese (`zh_sg`) and Malay (`ms_sg`) are new languages of the project. SINGAPORE TAMIL, HINDI AND BENGALI ARE SEPARATE ROLES from their Indian counterparts: same language, different country, different universes (`ta_sg`, `hi_sg`, `bn_sg` instead of `ta_in_tn`, `hi_in_dl`, `bn_in_wb`). Your task tells you which country you are assigned to; never use the other country's universes.

2. Talk to Hatch in your assigned locale's language, naturally as the persona would. Mixing languages is fine when people there really do it (romanized Hindi with English, Québécois French, Tanglish). English India (en_in) writes naturally in English. Never translate an English prompt word for word.

3. Judge like a native speaker. Does the reply sound natural, or like a translation? Is the politeness level right (tu/vous, aap/tum, Japanese politeness levels)? A formal reply is not automatically cold. Is it in the user's language and script? Are names, dates, money, addresses and holidays done the local way?

4. Write your rationale in English, so reviewers who do not speak the language can check it. When a word does not translate, quote it in the original language, in quotation marks, and explain it in English.

Words you will see everywhere

Persona - the pretend person you play.

Universe - the persona's whole digital world (emails, calendar, messages, notes, health data...).

Apps - the tab in Hatch where you read that world.

Task prompt - your first message to the assistant, written as the persona.

Arm A / Arm B - the two versions of the assistant answering you side by side.

Dimension - one of the eight things you compare: Style and behavior, Correctness, Style, Coherence & writing quality, Helpfulness, Completeness, Tone, Warmth.

Preference - your overall pick between A and B.

Absolute quality - how good the preferred reply is on its own (Perfect, Good or Bad).

Required rationale - your written reason, in English. Always required.

Protocol - the set of rules a Hatch session runs on. Your task form names yours.

Locale - your language and country together, written as a code such as `fr_ca` or `pt_br_sp`.

HAI - Handshake AI, where your task lives and you get paid.

Hatch - the customer's tool, where the conversation happens.

Your Role: Judge

You are not scoring A and B in isolation. Every dimension is comparative - **1 favours A, 3 is a Tie, 5 favours B**. Your job is to name the concrete difference that decides it, and to make sure your Preference, scores and rationale all tell one story.

What "better" sounds like

Same moment, two replies. A long-time user who texts in clipped lowercase asks Hatch to rebook a flight. Both rebooked the flight.

✓ SOUNDS HUMAN

on it. flight's rebooked. you're now landing 6:40, you can still make the dinner.

✗ SOUNDS LIKE A BOT

Got it - happy to help! I've gone ahead and rebooked that flight and saved the info in your flighttracker.md file (790357887). As your always-on, golden-retriever-loyal travel sidekick, I made sure you're all set - you now land at 6:40. Do you want me to check on the dinner reservation too?

The second buries the answer under a ceremony opener, a forced persona, a filename with an ID number, and a forbidden "Do you want me to…" closing. That gap is what this project measures.

Project Octahedron

Start here. What the project is, the order of the work, and the two gates you cannot skip.

Your rationale is written in English. Always.

The Hatch conversation is in your language. Everything you write yourself in the form — the **Required rationale** and any notes — is in **English**. The rationale covers the Preference, the **Absolute quality**, and **the dimensions where something stood out** - lead with what decided the pick, do not restate every rating, and write more than five sentences. When the language itself drove a score — register, idiom, honorifics, script, code-mixing, a local expression — **quote the exact words in the original language and explain in English what a native speaker reads into them**, as the example rationales illustrate. A rationale in another language, or one that only restates the scores, is sent back.

New here? Start with the plain-words version

The Introduction walks you through one whole task, step by step, in plain words: who you pretend to be, what you look at, what you write, and what you judge. Read it once, then come back here for the exact clicks.

One annotation round = one prompt message

Start annotation → send one prompt → review both model responses → grade.

Do not send follow-ups or additional messages within the round, even if the model has not completed the goal. If a model asks a clarifying question or leaves the goal unfinished, score what it actually produced from your one prompt, with the usual rubric.

IMPORTANT: Hatch's on-platform guidelines may still contain different or older instructions. **DO NOT FOLLOW HATCH GUIDANCE THAT ASKS YOU TO SEND MULTIPLE MESSAGES, ADD FOLLOW-UPS, OR CONTINUE UNTIL THE GOAL IS COMPLETE.** Follow this project's one-message rule above. The rest of Hatch's instructions still apply.

What the project is for

In each task you do three things:

1. Send Hatch one prompt, based on your persona's world (the emails, calendar, messages and other records of the pretend person you play).
2. Compare the two replies you get back. Judge how well each one communicates.
3. Record your judgment so that another reviewer can check it.

What this project measures is language. Behind the scenes, both arms (the two versions of the assistant) usually do the same work. What makes them different is how they write it back to you: the voice, the register (how formal or casual it sounds), the tone and the structure.

Correctness still counts. You still check every fact and every action against the person's world. But your main judgment is about the communication.

You use two systems for one task:

- **Handshake AI (HAI)** holds the task, the prompt, your evaluation and the QC checks (QC means quality control: automatic checks on your work).
- **Hatch** runs the session and creates the two replies.

So you write and check in HAI, you run the conversation in Hatch, and then you come back to HAI to get paid.

Is this your first time? Do VPN setup and Hatch setup once, then come back here.

The order of work

Every task follows the same twelve steps, always in this order. Steps marked **GATE** are hard stops: you cannot go on until that step is true.

The order - HAI writes and checks, Hatch runs, HAI pays

HAI
1. HAI task claimed
You clicked Start task, so your paid time is running

HATCH
2. Hatch session linked
Named youralias_task_N, with GAIA PREFERENCE, the right universe and your protocol for this task

GATE
3. HAI prompt green
Do not continue until: Every prompt check passes before you open the annotation

HATCH
4. Hatch responses complete
Both arms finished, got the same single prompt with no follow-ups, and nothing was rebuilt by hand

GATE
5. HAI evaluation green
Do not continue until: Preference, Absolute quality, the eight dimensions and the Required rationale pass QC

HAI
6. Required Notes complete
Every required text box is filled in - one empty box stops you from submitting

HATCH
7. Submit preference, then End comparison
You clicked both, in that order

GATE
8. The exact session shows completed
Do not continue until: Matched by name and UUID (the session ID), not by the row next to it

HAI
9. Required screenshots captured
Screenshot 1 (1-2 images of A/B responses), the scoring panel (1-5 images), and the confirmed screenshot (exactly 1 image of the finished comparison)

GATE
10. Not ended mid-annotation
Do not continue until: The session does not say "Ended mid-annotation"

HAI

11. Session UUID and attestation complete
UUID copied from Hatch, and the confirmation answered truthfully

HAI

12. HAI task submitted
Only after every gate above is met

The four hard gates

A gate is a point you cannot pass until a condition is true. There are four:

No Hatch annotation before the HAI prompt is green. First write the prompt in HAI and pass every prompt check. Only then paste it into Hatch.
No Hatch submission before the HAI evaluation is green. Enter the Preference, the Absolute quality, the eight dimension scores and the Required rationale in HAI first. They must pass QC before you click Submit preference.
No HAI submission before the exact Hatch session is verified complete. Find your session by its name and its UUID. Make sure it does not say **Ended mid-annotation**.
No HAI submission before the submission gate is satisfied. That means: Required Notes filled in, the three required HAI image fields captured (Screenshot 1, the scoring panel screenshot, and the confirmed screenshot of the completed comparison), and the confirmation answered truthfully.
One Hatch session = one Handshake task. One annotation round is one prompt message: send it, review both responses, grade. If the Hatch guidelines pop-up asks for several rounds or follow-ups, do not follow that part. Then end the comparison, and open a new session for the next Handshake task.

A note never clears a gate. Ticking a confirmation that is not true never clears a gate either. All four gates, one line each, are on Quality checks. If a gate fails, fix the problem, or abandon the session and start a replacement - see When Hatch breaks.

Every locale, including English India - the four extra rules

This project is multilingual for every locale, including English India (en_in). Four rules from the client apply everywhere:

Pick your locale's universe. Each task lists the universe(s) for your assigned language **and** country. Pick one of the universes listed on your task, searching by language **and** country, and keep that same universe for later sessions. In Hatch's universe picker, type your locale code (fr_ca, es_mx, pt_br_sp, ja_jp, en_in, hi_in_dl, bn_in_wb, mr_in_mh, te_in_ap, ta_in_tn, gu_in_gj, ml_in_kl, zh_sg, ms_sg, ta_sg, hi_sg or bn_sg). Never use a universe from another locale, even in the same language: ta_in_tn is not ta_sg. Pick the same name in the HAI **Universe** dropdown. Chinese (zh_sg) and Malay (ms_sg) are new languages of the project. SINGAPORE TAMIL, HINDI AND BENGALI ARE SEPARATE ROLES from their Indian counterparts: same language, different country, different universes (ta_sg, hi_sg, bn_sg instead of ta_in_tn, hi_in_dl, bn_in_wb). Your task tells you which country you are assigned to; never use the other country's universes.
Talk to Hatch in your assigned locale's language, naturally as the persona would. Natural mixing of languages is fine where people really talk that way (romanized Hindi with English, Québécois French, Tanglish). English India (en_in) writes naturally in English. Never translate an English prompt word for word.
Judge the replies as a native speaker. Natural or translation-sounding? Right politeness level? Right script and the user's language? Names, dates, money, addresses and holidays done the local way? Details are on The 2+6 dimensions.
Write your rationale in English, leading with the signal that decided it. When the language itself drove a score, quote the exact words in the original language, in quotation

marks, and explain in English what a native speaker reads into them.
Your protocol for this task is shown on the task form: **Hatch RM Style Task — Multilingual v1**. Do not choose Hatch RM Style Task (without Multilingual), Preference-Derived RL rubrics, Avocado, or any other protocol.

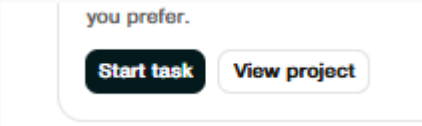

Do this now

Keep the live tasking page open
Live tasking has a checklist for each step. It also checks that your eight scores, Preference and Required rationale agree with each other before you submit.

Working session name
`youralias_task_N`
Copy
Replace youralias with your exact Slack alias in lowercase, and N with the task number.

Abandoned session name
`youralias_abandonedtask_N`
Copy
If a session cannot be used, rename it to this. Then run the task again in a new session with the same task number.

1. **Click Start task in Handshake**
   Open Project Octahedron in Handshake and click **Start task**. Keep the claimed task open the whole time you work. While it is open, your paid time is counted.

2. **Copy your alias from Slack**
   Open your Slack profile. Under About me, copy the **Alias** value. You need it to name the Hatch session `youralias_task_N`. For the full walkthrough, see Hatch setup.

3. **Create the Hatch session**
   Connect the VPN and open Hatch. Then, in this order: choose **Preference** (called GAIA PREFERENCE in HAI), type the session name, choose the universe, and choose your protocol for this task. Choose one of the universes listed on your task (type your locale code, such as `fr_ca`, in the universe picker), keeping the same universe for later sessions, and choose **Hatch RM Style Task — Multilingual v1**. Do not choose Hatch RM Style Task (without Multilingual), Preference-Derived RL rubrics, an Avocado protocol, or any other protocol. Then click **Create session**.

4. **Wait for RUNNING, then click Open**

Wait while Hatch prepares the session. When the status changes to **RUNNING**, click **Open** in the **Actions** column. The **Annotation guidelines** pop-up opens by itself. Read it, then close it with the **X**.

5. **Explore Apps, then start the evaluated task**

   Click **Apps** and find the real records your request will use. Write the prompt in **HAI** first, and pass every HAI QC check. Then, in Hatch, click **Start comparison**. Paste the exact approved prompt into the **Start annotation** box, and click **Start annotation**. This is the moment your evaluated task starts.

6. **Compare, submit the preference, end the comparison**

   Send no follow-up messages: one prompt, two responses, then grade. Read both arms in full. Check every action they say they did and every fact they state in Apps. While the Hatch comparison is still editable, enter the Preference, the Absolute quality, the eight dimension scores and the **Required rationale** (in English) in **HAI**. Run QC again and fix every failure. Only then submit in Hatch: click **Submit preference**, then **End comparison**. Capture the required HAI screenshots (the A/B responses, the scoring panel, and the confirmed completed comparison). Make sure the session did not end mid-annotation. Then fill in Notes and submit the HAI task to get paid.

Your topic

Your task may name a use-case category (a topic, such as Health & Fitness). If it does, work on that category. If it does not, pick the category that matches what your persona is really trying to achieve. Across your tasks, cover many categories instead of repeating one. Pick by the goal, not by the apps used. For example, *"move my Thursday run if it rains"* is Health & Fitness, even though it changes the calendar. All thirteen categories are on Write the prompt.

Complete a comparison task

Before you begin

Work through each item.

Checklist

0 of 7 complete

- [ ] Claim the Handshake task first. While it is open, your paid time is counted.
- [ ] Keep the task open the whole time you work.
- [ ] Name the Hatch session `youralias_task_N` before you click Create session.

- [ ] Choose Preference (GAIA PREFERENCE in HAI), one of the universes listed on your task, and your protocol for this task: **Hatch RM Style Task — Multilingual v1**.
- [ ] Click **Start comparison**, paste the prompt, then click **Start annotation**.
- [ ] Use only your persona's data.
- [ ] Never submit a session that is not complete.

See all non-negotiables

These rules are never optional:

1. Claim the Handshake task before you open Hatch. The open task is your 65-minute paid-time clock.
2. Type the Hatch session name `youralias_task_N` in the **Name** field before you click Create session. Rename a session only to fix a mistake.
3. Use **Preference** mode (GAIA PREFERENCE in HAI) and your protocol for this task, shown on the task form: one of the universes listed on your task for your language and country, kept the same for later sessions, and **Hatch RM Style Task — Multilingual v1**. Do not choose Hatch RM Style Task (without Multilingual), Preference-Derived RL rubrics, or an Avocado protocol.
4. Explore the persona first. Then click **Start comparison**, paste the prompt in the box, and click **Start annotation**. Anything you send before that only sets the scene. It is not your task.
5. Base the prompt on your persona's data, and invent nothing. You may rely on the live web only when the guidelines pop-up says **Internet: Available**. If it does not, the prompt must be answerable from the persona's records alone.
6. Only ask for actions the apps can really do - see app capabilities.
7. Send both arms the same single prompt, word for word. Send no follow-up messages within the round.
8. You are not told which model is behind each arm. Do not try to guess. Never let a guess about where a reply comes from change your choice. Judge only the replies.
9. Never submit when a response is missing, failed or cut off. Create the task again instead.
10. You do not have to check every step of the work behind the scenes. But you must check every fact and every claimed action that **Correctness** depends on. If a reply says "Sent", "created" or "updated", you must be able to see it in Apps.
11. Copy the session name, the session ID and the persona name exactly. The name and the ID are two different fields.
12. Your eight dimension scores, your Absolute quality, your Required rationale and your preference must all tell the same story. The preference is A or B: ties are not allowed.
13. Talk to Hatch in your assigned locale's language, naturally as the persona would (English India writes in English), and write the Required rationale in English - the dimensions that mattered (not a line per rating), more than five sentences, the Absolute quality explained, the language nuances quoted and explained.
14. In Hatch, submit the preference and end the comparison before you finish the Handshake form.
15. Notes can explain small problems. They never make up for missing work.

The one mistake you cannot undo

If a task comes back to you, you can still edit the scores and the Notes. You cannot fix a broken session. So if a response failed, was cut off, or did not get all your turns, create the task again. See When Hatch breaks.

How judging works, in one paragraph

What decides it

Both arms come from the same family of models. Each one gets an extra note about style. Each is told to use that note for how it writes, not for what it does. So both arms usually take about the same actions, and the comparison is mostly about communication. That is why Style, Tone, and Coherence & writing quality matter a lot here. But good style never makes up for a wrong action, missing work, a claim with nothing to back it up, or an invented fact. When the content is the same, the writing decides.

Longer is not automatically better, and shorter is not automatically better. Extra detail only counts when it adds useful information, action, context or structure.

When the two replies are close on correctness and completeness, the Style, Tone, and Coherence & writing quality dimensions can decide the preference. Again: style never makes up for a wrong action, missing work, a claim with nothing to back it up, or an invented fact. See Score and choose and The 2+6 dimensions.

What sends tasks back

These are the most common reasons a task is returned, and the page that helps you avoid each one.

Failure	Where it is prevented
The prompt needs the web, but the session has no internet access	Prompt builder
The prompt asks for an action the apps cannot do	App capabilities
One response arm never finished	When Hatch breaks
An action the reply claimed was never checked	Comparison workflow, step 9
A prompt turn or a transcript turn is missing	Complete the form

Failure	Where it is prevented
The scores, the Required rationale and the preference disagree	Score and choose
A 3 / Tie on a communication dimension where you can see the two replies differ	Score and choose
A pair that should have been skipped was scored anyway	When something breaks

Where everything lives

When	Page
Once, before your first task	VPN setup, Hatch setup
Doing a task, step by step	Comparison workflow
Keep open in a second tab while you work	Live tasking
Writing the prompt	Prompt builder, App capabilities
Judging and writing the rationale	Score and choose, The 2+6 dimensions, Complete the form
A last look before you submit	Two-minute check
Something broke	When Hatch breaks
Practice, and how good your work must be	Quality checks
Things you look up now and then	Reference, Examples, Common mistakes, FAQ

Next: Set up your tools.

Next

VPN setup

A *VPN* is an app that connects your computer to a private network. Hatch only lets in computers that come from Handshake's network. So you must turn on the VPN before you start working on tasks. Your username and password come from your Handshake onboarding email.

Edouard will send you your VPN login, your username and your password, on Slack.

Use Google Authenticator for 2FA

When you sign in, you will be asked for a second proof that it is really you. This is called 2-step verification, or *2FA*. Use the Google Authenticator app for it.

Your credentials come from your email

Your username is your assigned ID plus your project name. For example: `yourid-yourproject`. Your password is the random string of characters in the same email. Never paste your real username or password into the Handshake form, into Slack, or into a screenshot.

1. **Step 1 - Install OpenVPN Connect**

   Go to openvpn.net/client. Download the OpenVPN Connect app for your computer's system (for example Windows or Mac). Then install it.

2. **Step 2 - Add the Handshake server URL**

   Open the app. Choose to connect with a **Server URL**. Type in `https://openvpn.handshakecommunity.ai/`. Then click **Continue**.

3. **Step 3 - Sign in and import your profile**

   Sign in to the portal (the Handshake VPN website) with the username and password from your email. The username looks like `yourid-yourproject`. Download your personal profile file from the portal. A profile file holds your own connection settings. If OpenVPN Connect does not load it by itself, open the file with OpenVPN Connect.

4. **Step 4 - Connect**

   Select your `yourid-yourproject@openvpn.handshakecommunity.ai` profile and click **Connect**. If the app asks, type the same username and password again. You are connected when the app shows **Securely Connected!** and a green dot.

5. **Step 5 - Sign into Hatch**

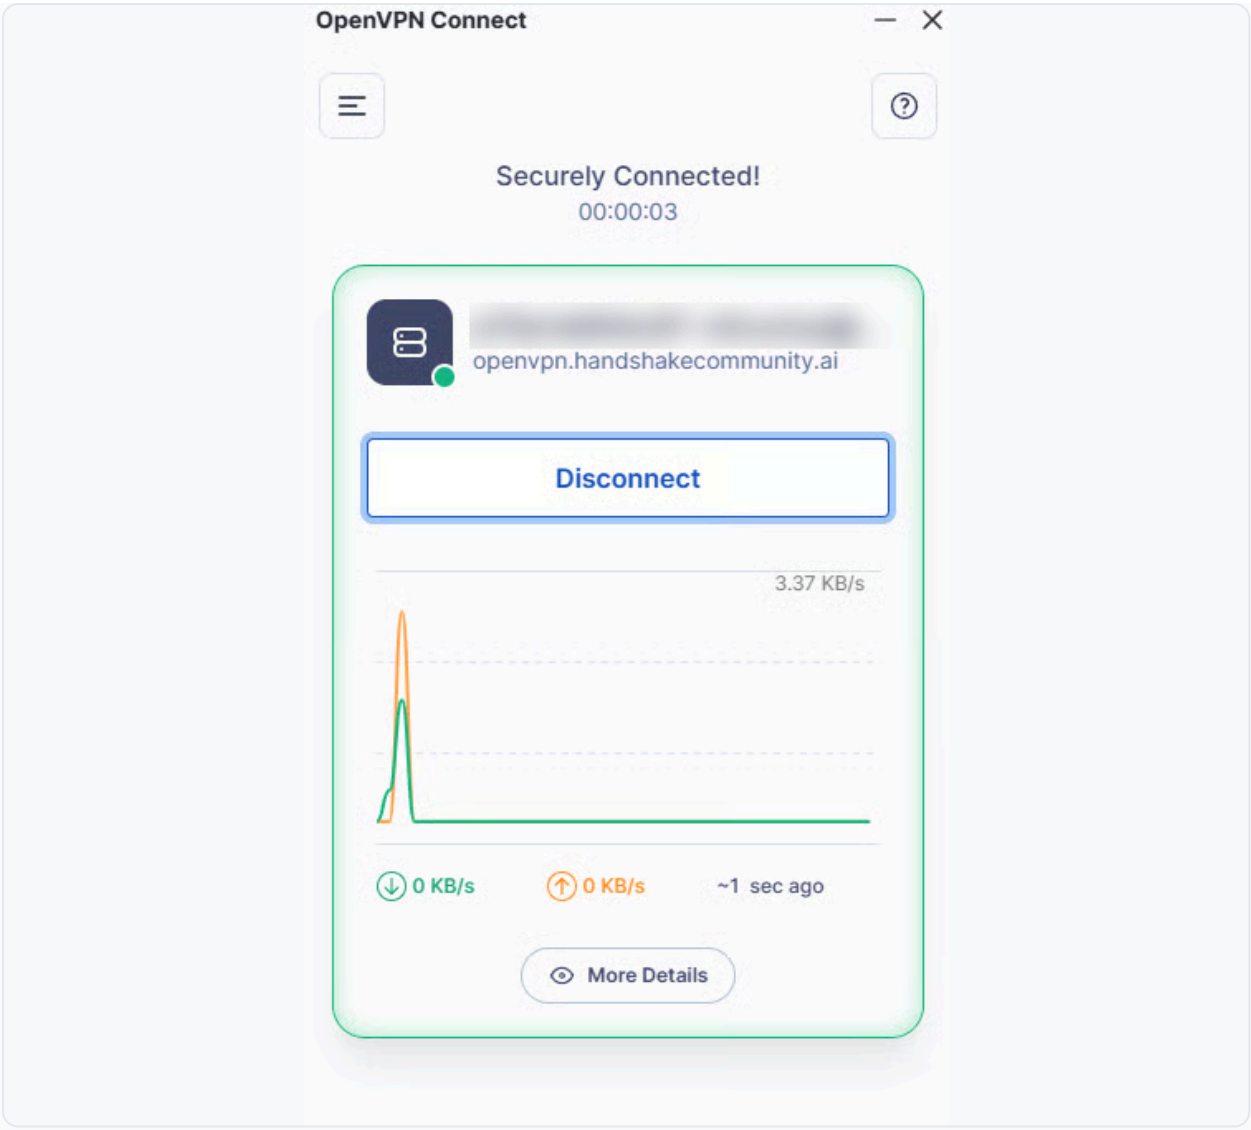

Keep the VPN connected. Go to Hatch and sign in with the link and the login details that Handshake gave you. If Hatch does not load, look at OpenVPN and check that it still shows **Securely Connected**.

Step 2 - type the Handshake server URL, then click Continue.

Step 4 - your profile shows up as yourid-yourproject@openvpn.handshakecommunity.ai. Click Connect.

Connected - the top of the app says Securely Connected! and the dot next to your profile turns green.

Next: Hatch setup.

Previous

Next

Hatch setup

Setup 2 of 2 - create your account, create a session, and open it.

Note: Your Hatch login details and the link to Hatch will come by email. Look for the subject line "Welcome to SIMS".

Create your hatch account

You need a Hatch account before you can work. First turn on the VPN (see VPN setup). Then create your Hatch account with the Handshake AI login details from your HAI project.

Use Google Authenticator for 2FA

When you sign in, you will be asked for a second proof that it is really you. This is called 2-step verification, or *2FA*. Use the Google Authenticator app for it.

Create the session

A *session* is one conversation in Hatch, with its own persona. You create one new session for each task.

Every session name starts with your Slack alias. Your *alias* is a short code that Handshake gave you. Copy it exactly; do not make one up. To find it, see What is my Slack alias? or the steps at the bottom of this page.

1. **Choose Preference**

   In the **Create session** card, click **Preference**. This is the session type where you compare two models and pick the one you prefer - it is called **GAIA PREFERENCE** in HAI. **GAIA RUBRICS** and **EDUCATION** belong to other projects. Do not choose them.

2. **Name the session before you create it**

   In the **Name** field, type `youralias_task_N`. Put your own alias in place of "youralias", and the task number in place of "N". For example: `youralias_task_1`. Get the name right from the start. Renaming is only for fixing a mistake.

3. **Choose the universe**

   The universe is your persona and their digital world. Your HAI task lists the universes for your assigned language **and** country. In the universe picker, type your locale code, for example `fr_ca`, to see only your locale's universes. Pick one of the universes listed on your task, and keep that same universe for your later sessions. Never pick a universe from another locale, even in the same language: `ta_in_tn` is not `ta_sg`.

4. **Choose your protocol for this task**

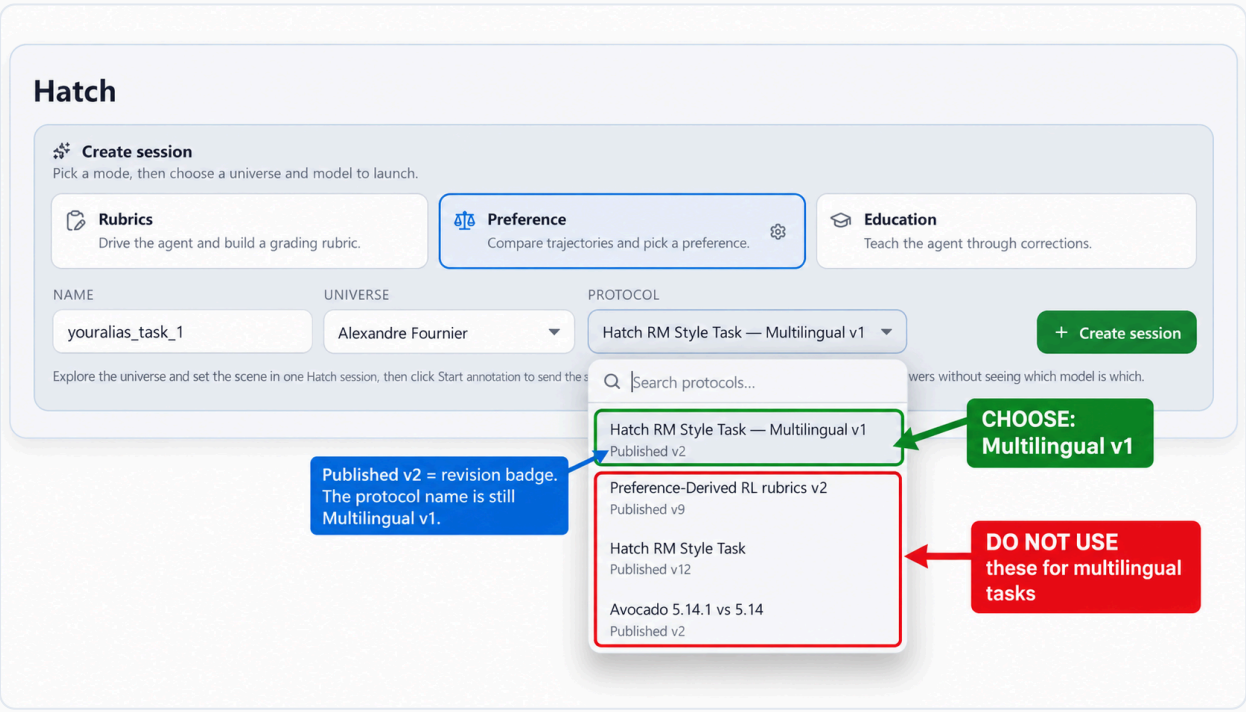

> The *protocol* is the set of rules the session runs on. Your HAI task form shows "your protocol for this task". Open **Protocol** and choose **Hatch RM Style Task — Multilingual v1**. Do not choose Hatch RM Style Task (without Multilingual), an Avocado protocol, Preference-Derived RL rubrics, or any other protocol.

5. **Click Create session**

   Click **+ Create session**. The session shows up in the list as provisioning, which means Hatch is still getting it ready.

The whole **Create session** card, in order: choose **Preference**, name the session `youralias_task_N`, pick your universe (shown here is Alexandre Fournier, fr_ca, as an EXAMPLE only - use one of the universes listed on your own HAI task), choose **Hatch RM Style Task — Multilingual v1**, then click **+ Create session**.

Choose **Hatch RM Style Task — Multilingual v1** in the dropdown. The revision badge reads **Published v2** - that is the protocol's published revision, not its name. Do not choose Preference-Derived RL rubrics v2, Hatch RM Style Task, or Avocado.

The protocol version is not the persona version

Pick **Hatch RM Style Task — Multilingual v1**, the protocol your task form names. Its separate revision badge may say something like **Published v2** - that is the protocol's published revision, not a different protocol name. Do not pick Hatch RM Style Task (without Multilingual), Preference-Derived RL rubrics, Avocado, or any other protocol.

This protocol revision number has nothing to do with the persona version. Your persona version comes from the **Universe** you pick: use one of the universes listed on your task. Subpersonas (smaller variations of a persona) are fine.

The apps you actually have govern: use the apps really present in your session, and any persona apps your task lists, rather than assuming a fixed set by protocol version. See app capabilities.

Pick your own locale's universe

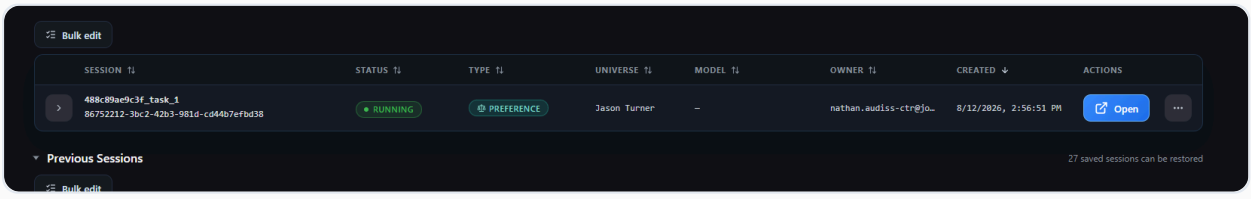

Your task lists the universes for your assigned language **and** country: search by **language and country**. Each one is a persona living in that country, with emails, chats, calendar and notes written the way people there write. Type your locale code in Hatch's universe picker to see only yours: fr_ca, es_mx, pt_br_sp, ja_jp, en_in, hi_in_dl, bn_in_wb, mr_in_mh, te_in_ap, ta_in_tn, gu_in_gj, ml_in_kl, zh_sg, ms_sg, ta_sg, hi_sg or bn_sg.

Pick one of the universes listed on your task, and keep that **same universe** for your later sessions. Never use a universe from another locale, even if it is the same language. For example, `ta_in_tn` (Tamil, Tamil Nadu) is not `ta_sg` (Tamil, Singapore). If a task specifically identifies a persona, follow that task; never infer the persona from the protocol version. Later, pick the **same persona name** in the HAI **Universe** dropdown.

Chinese (zh_sg) and Malay (ms_sg) are new languages of the project. SINGAPORE TAMIL, HINDI AND BENGALI ARE SEPARATE ROLES from their Indian counterparts: same language, different country, different universes (ta_sg, hi_sg, bn_sg instead of ta_in_tn, hi_in_dl, bn_in_wb). Your task tells you which country you are assigned to; never use the other country's universes.

Open the session

Once Hatch has finished getting the session ready, you can go into it.

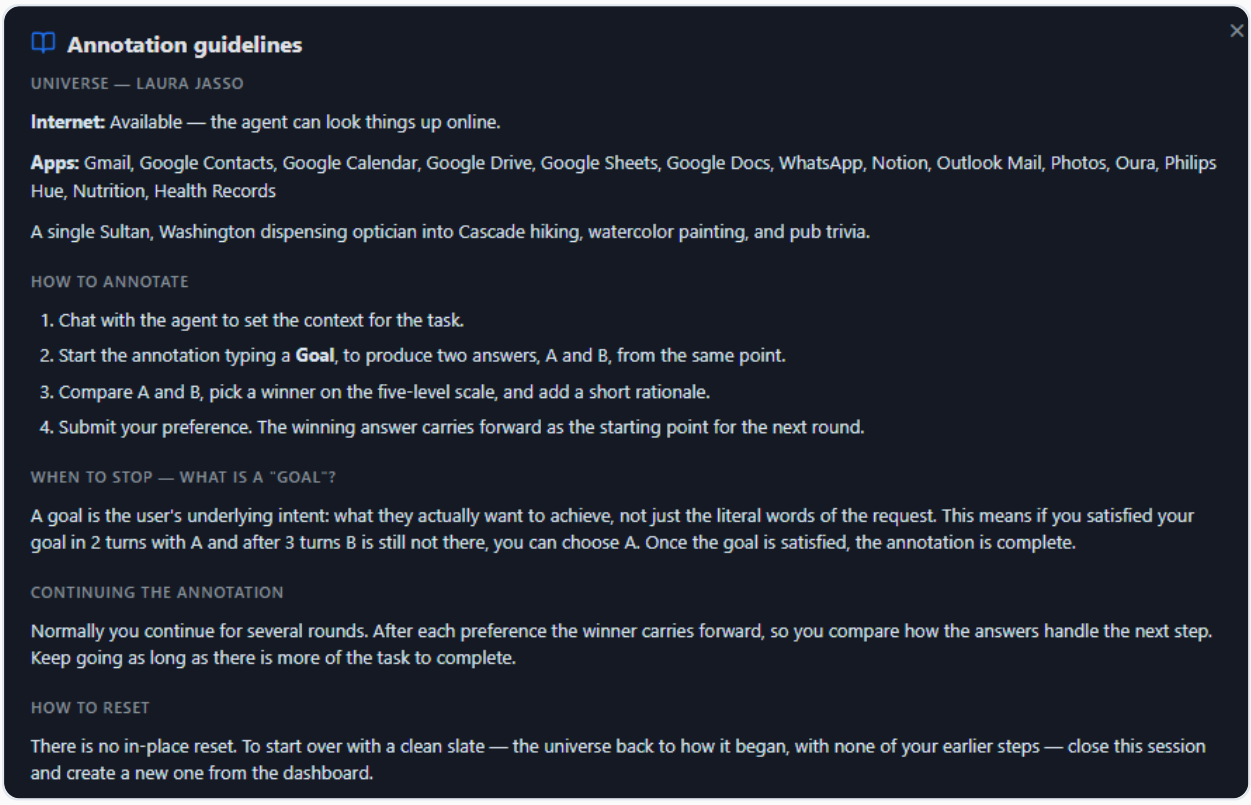

When the status changes to RUNNING, click Open in the Actions column.

- Wait until the status changes from **PROVISIONING** to **RUNNING**.
- Click **Open** to go into the session.
- Next to **Open** there is a three-dot menu. Use it to **Rename** the session, but only if the name is wrong.
- **Restart** and **Delete** are not part of the normal steps. Do not use them as part of your work.

- If you have to give up on a session, rename it `youralias_abandonedtask_N`. Then follow When Hatch breaks.

Read the guidelines modal

When the session starts, a pop-up window (a *modal*) opens with guidelines. Read it before you begin.

This pop-up opens when the session starts. Read the persona, the apps you can use, and the guidance on how to work. Then close it with the **X**.

It tells you three things: the universe and persona you chose, the connected apps you can use in this session, and the basic rules for how to work.

Check whether the environment has internet access

Some sessions show **Internet: Available** - a clear signal that the assistant can look things up on the live web, so your prompt may depend on that. Not seeing that label does not by itself prove there is no access: persona-grounded public research can still be fine when the session's actual capabilities or current instructions support it. Either way, never assume access to undisclosed private data, and the task must still be *grounded*: based on real records in the persona's world. See Prompt builder.

One annotation round = one prompt message

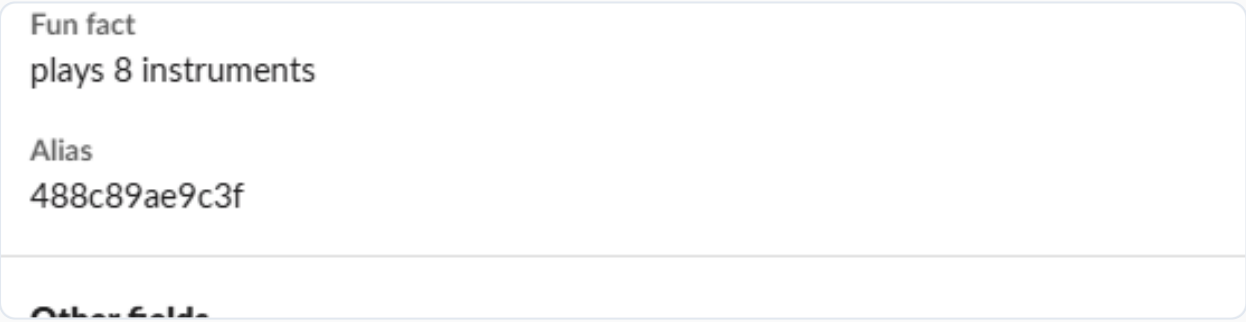

Start annotation → send one prompt → review both model responses → grade.

Do not send follow-ups or additional messages within the round, even if the model has not completed the goal. If a model asks a clarifying question or leaves the goal unfinished, score what it actually produced from your one prompt, with the usual rubric.

IMPORTANT: Hatch's on-platform guidelines may still contain different or older instructions. **DO NOT FOLLOW HATCH GUIDANCE THAT ASKS YOU TO SEND MULTIPLE MESSAGES, ADD FOLLOW-UPS, OR CONTINUE UNTIL THE GOAL IS COMPLETE.** Follow this project's one-message rule above. The rest of Hatch's instructions still apply.

Reference: Find your alias in slack

1. Click your picture in Slack, then click Profile.

2. In your profile, find Alias under About me. Copy it exactly. The alias in this picture is only an example; use your own.

Session name format: `youralias_task_N`. For example: `488c89ae9c3f_task_1`.

Next: Comparison workflow.

Previous Next

Comparison workflow

Do a task - the eleven steps in order, from claiming it in HAI to getting paid.

Practise this before your next task

Quality checks puts the hard rules, the table of what each app can do, and the screenshot rules in one place. It also links to the practice page. There you can write a task prompt and record a judgment, and get rehearsal feedback modeled on those checks. The real HAI QC and reviewer acceptance still judge your actual task against its current evidence and schema.

One annotation round = one prompt message

Start annotation → send one prompt → review both model responses → grade.

Do not send follow-ups or additional messages within the round, even if the model has not completed the goal. If a model asks a clarifying question or leaves the goal unfinished, score what it actually produced from your one prompt, with the usual rubric.

IMPORTANT: Hatch's on-platform guidelines may still contain different or older instructions. **DO NOT FOLLOW HATCH GUIDANCE THAT ASKS YOU TO SEND MULTIPLE MESSAGES, ADD FOLLOW-UPS, OR CONTINUE UNTIL THE GOAL IS COMPLETE.** Follow this project's one-message rule above. The rest of Hatch's instructions still apply.

This page is the whole task, in order. Open one step at a time and work your way down. Everything a normal task needs is here. If a step needs more help, it links to it.

HAI decides, Hatch does the work. You claim the task in HAI. The comparison runs in Hatch. Then HAI decides whether your finished task is accepted. Always follow this order. If you create a Hatch session before you claim the HAI task, that time is not paid. If you submit the HAI task before the Hatch evaluation is complete, it is rejected.

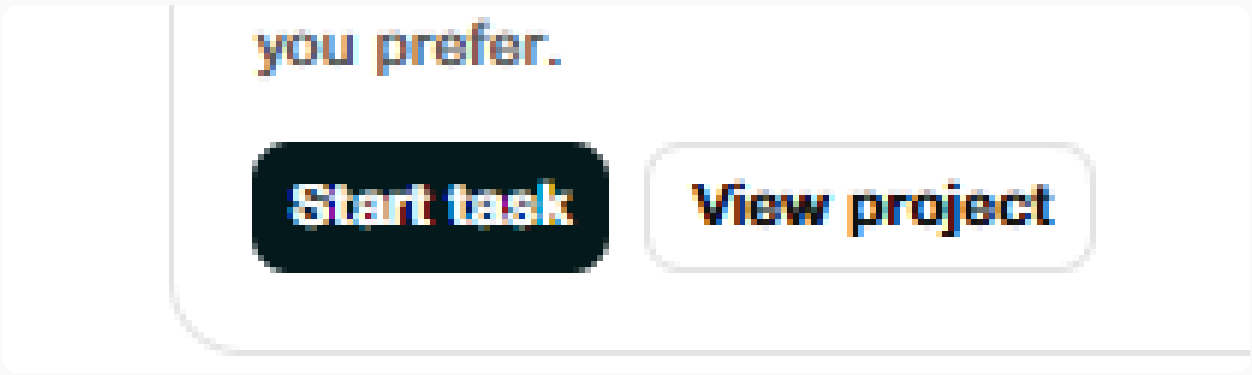

You can see the whole order at a glance on How a task works and on Live tasking. The eleven steps below are the same order, in detail.

Keep the live tasking page open

Live tasking has a checklist for each step. It also checks that your eight scores, Preference and Required rationale agree with each other before you submit.

1. Start the Handshake task

Open Project Octahedron in Handshake and click **Start task**. Keep the task open until you finish. While it is open, your paid time is counted.

Done when the task is claimed and open in a browser tab, and you have not opened Hatch yet.

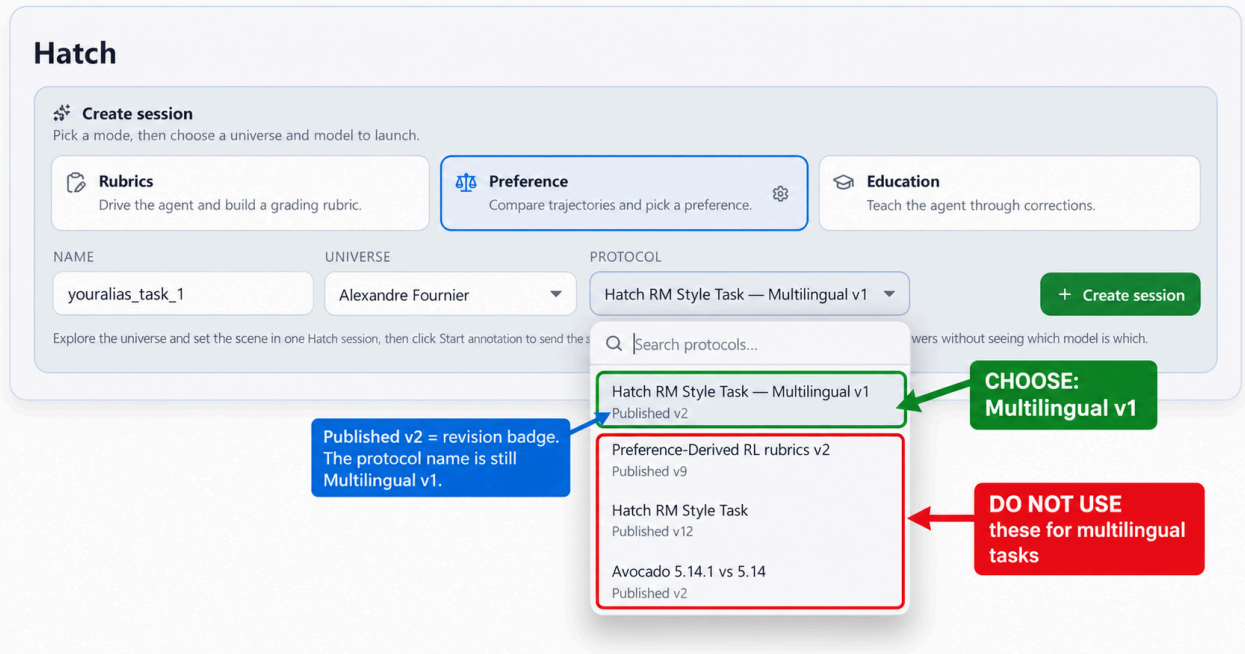

Common mistake: working in Hatch first. Time spent without an open task is not counted.

---

2. Create the Hatch session

Connect the VPN and open Hatch. Then fill in the **Create session** card:

1. Choose **GAIA PREFERENCE**. Not GAIA RUBRICS, and not EDUCATION.
2. Type the session name into the **Name** field: `youralias_task_N`. Your alias comes from Slack - see Hatch setup.
3. Choose the **Universe**. Your task lists the universes for your assigned language and country. Type your locale code (for example `fr_ca`) in the universe picker to see only your locale's universes. Pick one of them, and keep the same one for later sessions. Never pick one from another locale, even in the same language (`ta_in_tn` is not `ta_sg`).
4. Choose your protocol for this task, as shown on the HAI task form: **Hatch RM Style Task — Multilingual v1**. Do not choose Hatch RM Style Task (without Multilingual), Preference-Derived RL rubrics, an Avocado protocol, or any other protocol.
5. Click **Create session**.

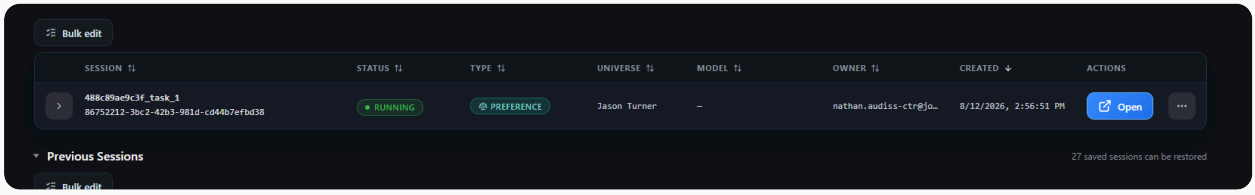

Done when all four are true: the mode is Preference (GAIA PREFERENCE in HAI), the Name field says `youralias_task_N`, the universe is one of those listed on your task, and the protocol is **Hatch RM Style Task — Multilingual v1** (its revision badge may say Published v2 - that is the revision, not a different protocol).

Common mistake: choosing Hatch RM Style Task (without Multilingual), Preference-Derived RL rubrics, an Avocado protocol, or any protocol other than your protocol for this task. Picking a universe from another locale. Help: Hatch setup.

---

3. Wait for RUNNING, then click Open

After you click **Create session**, wait while Hatch prepares the session. The status first shows **PROVISIONING** (getting ready). When it changes to **RUNNING**, click **Open** in the **Actions** column.

You should now see the session status RUNNING and an Open action. If you do not, wait before you go on.

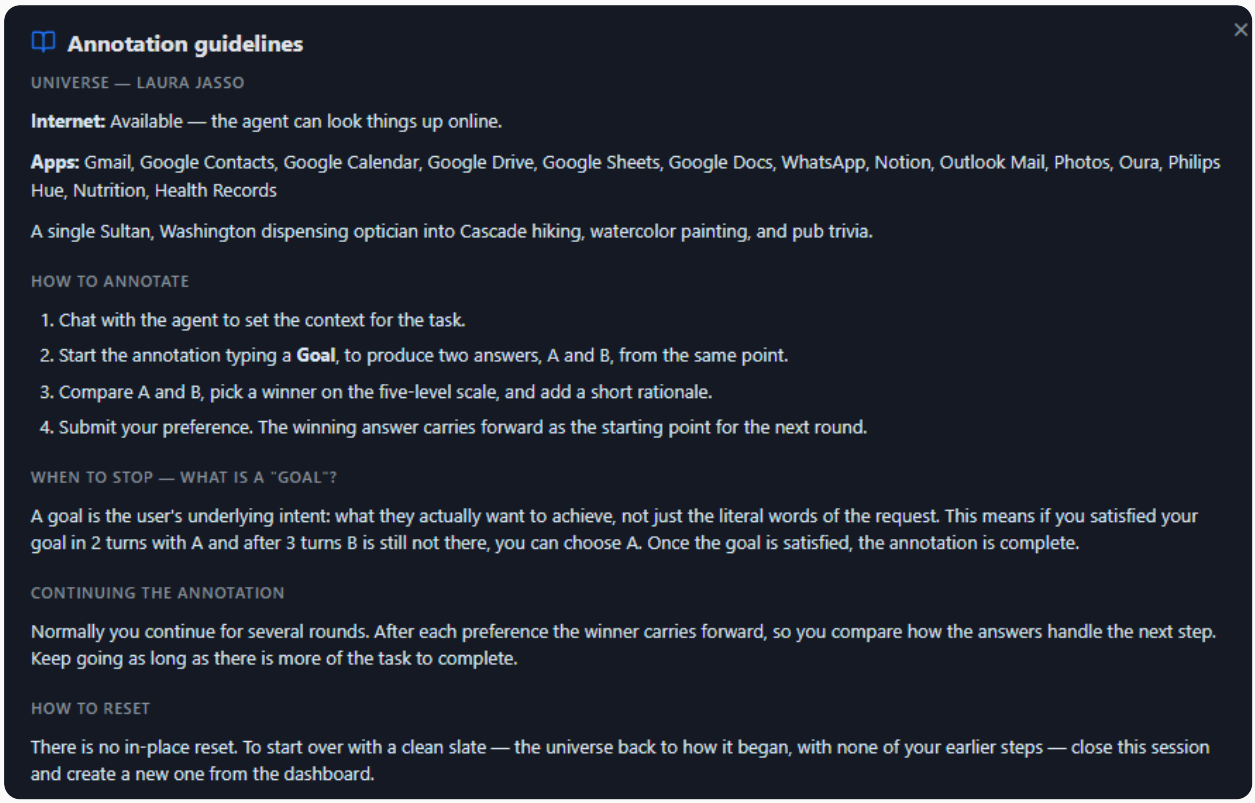

The three-dot menu has a **Rename** option. Use it only if the name is wrong. **Restart** and **Delete** are not normal steps.

Common mistake: submitting a session whose name is a UUID (a long string of letters and numbers). The session name and the session ID are two different things - see Complete the form.

---

4. Read the guidelines modal

The **Annotation guidelines** pop-up opens by itself. Read it, then close it with the **X**.

You should now be inside the session, with the Annotation guidelines pop-up showing.

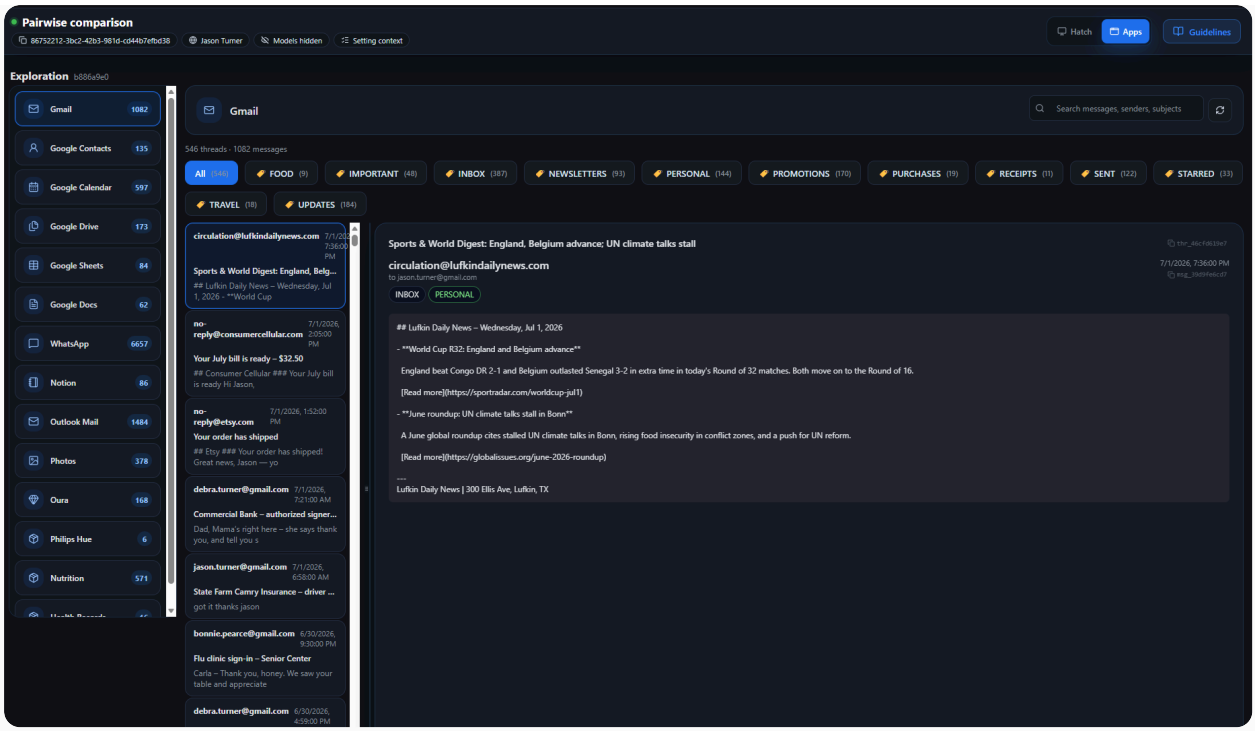

The pop-up lists your persona, the connected apps, and the basic rules for the session. Look for the words **Internet: Available**.

- If you see them, the assistant can look things up on the live web, and your prompt may depend on that.
- If you do not see them, your prompt must be answerable from the persona's records alone.

---

5. Explore Apps and find real records

Click **Apps** in the top right and look through the persona's apps. Find the real records your request will depend on: emails, calendar events, messages, files, health records or others.

Only look around for now. Do not start the task conversation yet.

Common mistake: writing the request first and hoping the records match it. Help: Prompt builder and App capabilities.

---

6. Write the prompt in HAI and clear prompt QC

Write one request, in the first person ("I", "my"), in the persona's own voice. Base it on records that really exist. Type it in **HAI**, not in Hatch. Then run every HAI QC check (the automatic quality checks) and the evaluation page. Do not open the Hatch annotation until the prompt passes.

Done when all six are true:

- It is based on real persona data, usually more than one record.
- It needs the apps, not just a chat.
- It can be answered without the public web - unless the guidelines pop-up says **Internet: Available**.
- The apps can do every action it asks for.
- The persona's records cover the dates it mentions.
- The goal is clear, without spelling out every click.

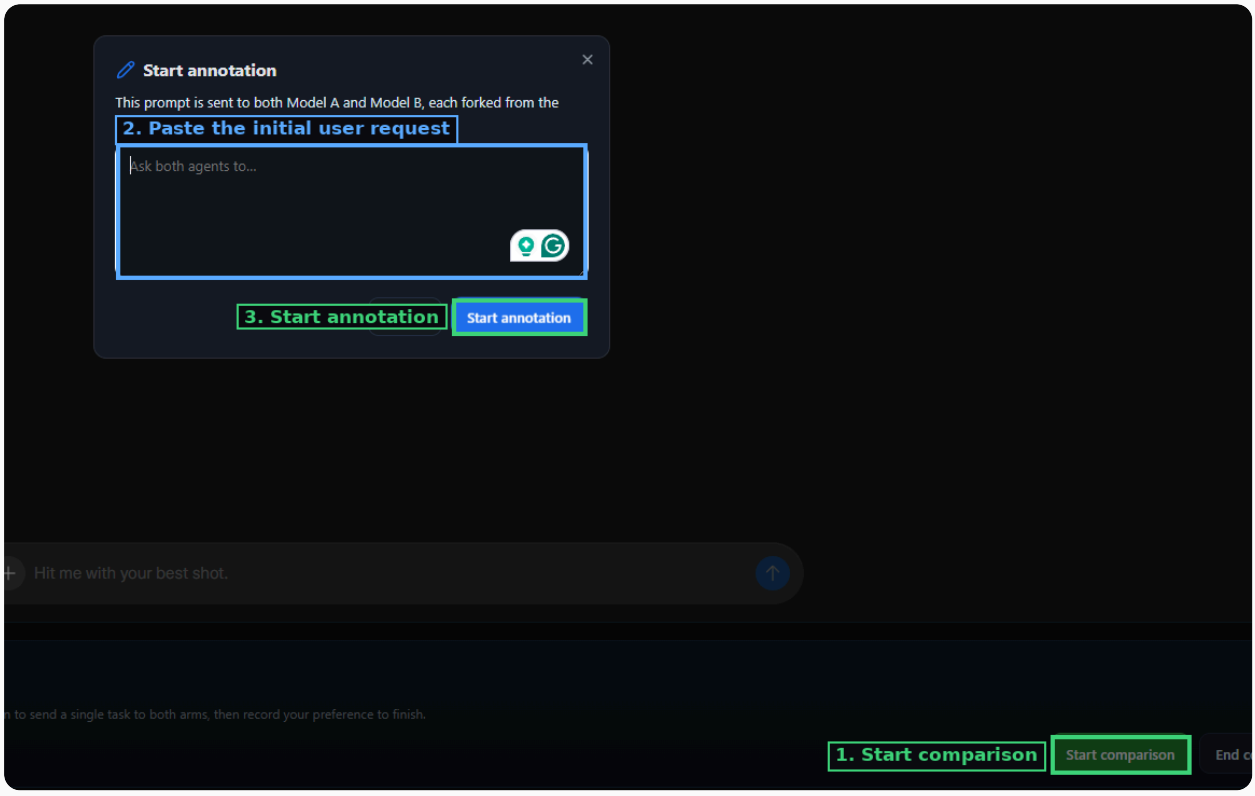

Write the prompt in your assigned locale's language, naturally the way the persona writes, including natural language mixing if people there talk that way (English India writes naturally in English). Never translate an English prompt word for word.

Common mistake: a request that needs up-to-date public information (for example, today's news). Help: Prompt builder and App capabilities.

---

7. Start comparison → paste the request → Start annotation

1. Click **Start comparison** at the bottom right.
2. The **Start annotation** box opens.
3. Paste the **exact approved prompt** from HAI into that box. Copy it word for word. Do not edit it.
4. Click **Start annotation** inside the box.

Everything before this point is setup and looking around. Your evaluated task starts when you click Start annotation.

You should now see Arm A and Arm B. Your evaluated task has started.

Common mistake: looking for Start annotation before you open the comparison. The box only appears after you click **Start comparison**.

---

8. Read both arms - one prompt, no follow-ups

Read both arms side by side. This round is one prompt message: do not send another message to clarify, insist, retry or continue.

- If an arm asks you a question or leaves the goal unfinished, do not answer it. Score what it actually produced from your one prompt, with the usual rubric.
- Do not give one arm extra instructions or opportunities the other does not get.

One session, one Handshake task. If the Hatch **Annotation guidelines** pop-up asks for several rounds, follow-ups, or continuing until the goal is complete, do not follow that part. Evaluate, end the comparison, and create a **new** session for the next Handshake task.

Done when both arms got the same single prompt, both replies finished completely, and you read them in full.

If an arm did not finish: stop. Do not score it and do not submit. First retry the failed arm. If that does not work, retry the session. If it still cannot be saved, rename it

`youralias_abandonedtask_N`, create a new session, and run the task again from the beginning. Notes cannot fix a reply that is missing, failed, copied, rebuilt by hand or cut off. Help: When Hatch breaks.

---

9. Check the facts and actions behind Correctness

You do not need to check every step of the work behind the scenes. But sometimes a reply **does something or states a fact from the person's world**: a date, a name, a number, who a message went to, or something it says it did. Check those in **Apps** before you score Correctness. Sounding smooth and sure is not the same as being right.

Ask yourself:

- Does the draft it talks about really exist?
- Does the calendar event really exist?
- Did it use the right app?
- Did it send something that it should only have drafted?
- Were the recipient, date, time, attachment and content right?
- Did the model claim an action the app cannot do?

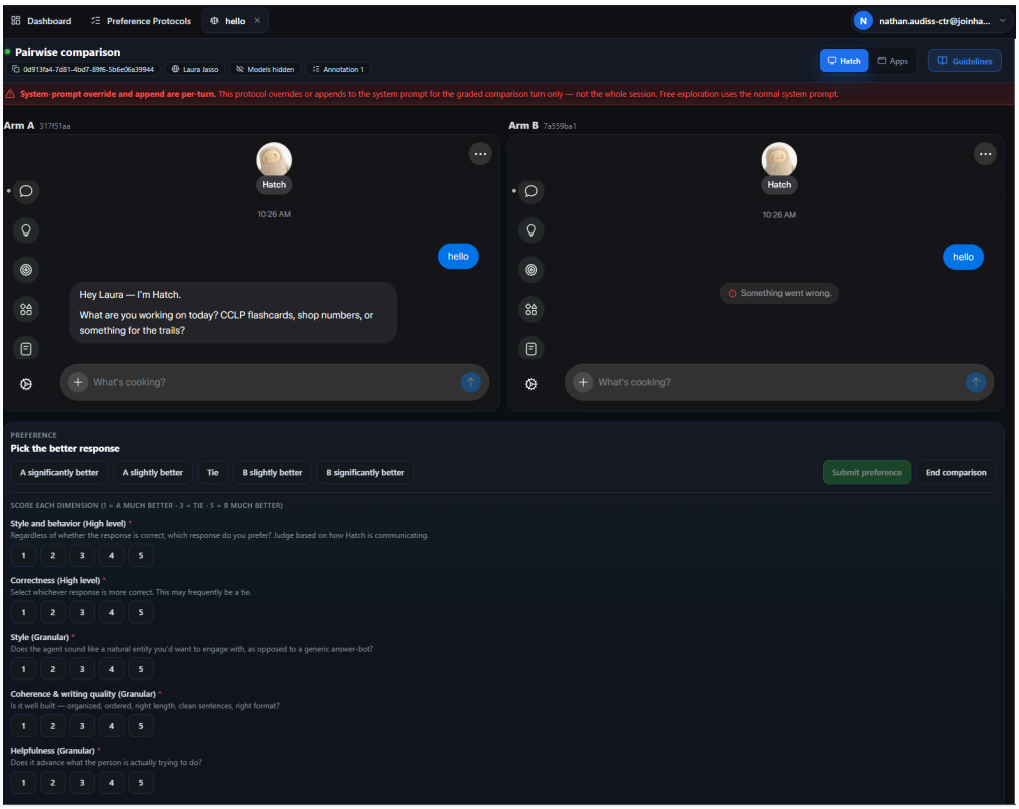

Common mistake: scoring the words instead of the work. Help: App capabilities.

---

10. Enter the evaluation in HAI, clear QC, then submit in Hatch

While the Hatch comparison is still editable, enter the Preference, the Absolute quality, the eight dimension scores and the **Required rationale** in **HAI**. Run every HAI QC check again (these are precommit evaluation checks) and fix every failure until nothing needs attention. Only then, in Hatch, click **Submit preference**, then click **End comparison**. Judge the whole conversation, including any turns where you had to bring a model back on track.

1. **Score all eight comparative dimensions.** A dimension is one thing you compare, such as Tone. Give each one value: **1 = A significantly better · 2 = A slightly better · 3 = Tie · 4 = B slightly better · 5 = B significantly better**. The dimensions are Style and behavior (High level), Correctness (High level), Style (Granular), Coherence & writing quality (Granular), Helpfulness (Granular), Completeness (Granular), Tone (Granular), and Warmth (Granular).
2. **Choose the overall Preference:** A significantly better · A slightly better · B slightly better · B significantly better. Ties are not allowed: pick A or B, then rate that response's Absolute quality. Hatch shows a Tie button; never use it. This is your main judgment. It is not the average of the eight numbers.
3. **Rate the Absolute quality** of the preferred response: **Perfect**, **Good** or **Bad**. This applies to every locale, including English India - a winner can still be Bad.
4. **Write the Required rationale, entirely in English.** Explain your preference, then cover the dimensions where something stood out - point to something concrete for each of those, and skip the ones with nothing to say rather than restating their ratings. Write more than five sentences, and make every one of them carry signal. On a language task, also explain the Absolute quality. When a word does not translate, quote it in the original language, in quotation marks, and explain it in English.
5. Click **Submit preference**.
6. Click **End comparison**.

This screenshot shows a failed example. Do not score anything like it. If either live arm says "Something went wrong," is missing, or is cut off, stop. Retry or recreate the session. Never submit a comparison that is not complete.

The full definitions of the eight dimensions, and what the red RM Style banner means, are on Score and choose a preference.

Score each dimension on its own. For example, A can be more correct while B communicates better. On a language task, judge as a native speaker of the locale: natural or translated, the right register, the user's language and script, local names, dates and money - see The 2+6 dimensions.

3 means no meaningful advantage. On the six communication dimensions, a 3 says neither reply has a meaningful advantage on that dimension - not that the two are literally identical. Look closely: if there is a real, evidenced difference, score it 2 or 4, but never fabricate a delta just to avoid a tie. A pattern of ties is a reason to look harder, not an automatic failure. Correctness is where a genuine tie is most common, because the two arms usually do the same work. Full definitions: The 2+6 dimensions. Length is not a score. Longer is not better, and shorter is not better.

Done when all of these are true:

- All eight scores are filled in, and the Absolute quality - every locale, including English India.
- The Required rationale is entirely in English.
- No communication dimension is a 3 unless neither reply has a meaningful advantage on it.
- Every dimension that influenced the pick has concrete support in the Required rationale, and no line merely restates a rating.
- The Preference and the rationale agree.
- A and B are not swapped.
- Length alone did not pick the winner.
- You submitted the preference and ended the comparison.

Common mistake: making all eight numbers favour the same arm on purpose, or rewarding the longer reply. Help: Score and choose.

---

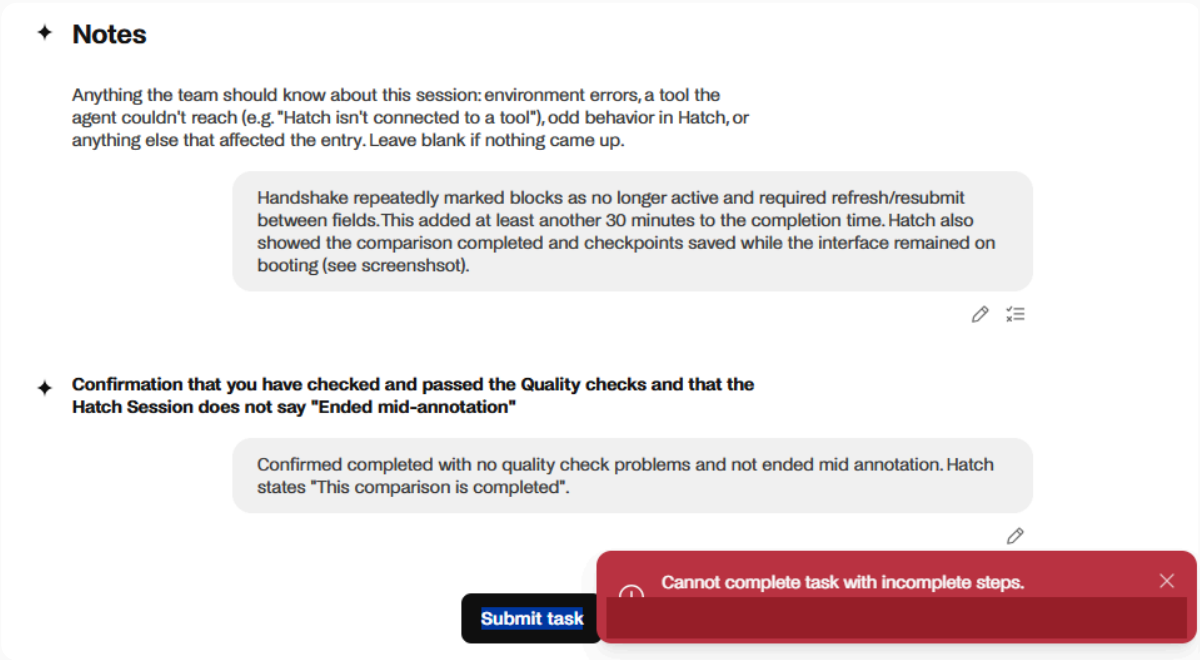

11. Verify the exact session, capture the required screenshots, then submit for payment

Go back to the Hatch sessions list. Find **the session you worked in**. Match it by its name **and** by the session UUID you are about to enter. Make sure that row says completed and does **not** say **Ended mid-annotation**. A completed row next to yours does not prove anything about your session.

Then capture the three required HAI image fields: **Screenshot 1** (1-2 images showing the actual A/B responses side by side), the **Screenshot scoring panel** (1-5 readable images showing the final matching Preference, Absolute quality, all eight ratings and Required rationale), and the **Confirmed screenshot** - exactly one image proving this exact Hatch comparison is finished, with completed status and the matching comparison UUID. The confirmed screenshot is not the sessions dashboard and not a filled-but-unsubmitted scoring panel.

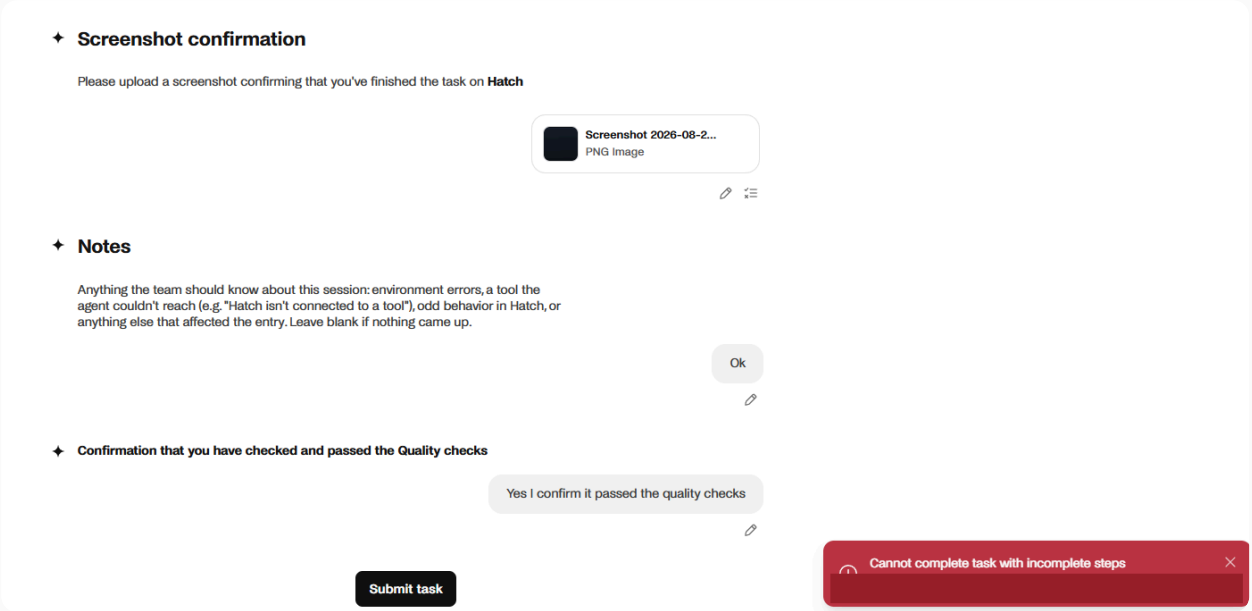

Next, fill in the HAI form:

- Copy the session name and the session UUID exactly.
- Enter the persona's human name.
- Pick the category that matches the user's goal.
- List the apps that both arms really used.
- Paste every user turn, in order.
- Add the transcripts your task asks for.
- Fill in the required **Notes** box: write N/A or None if there is no issue, otherwise describe the issue in your own words.
- Answer the confirmation box truthfully.

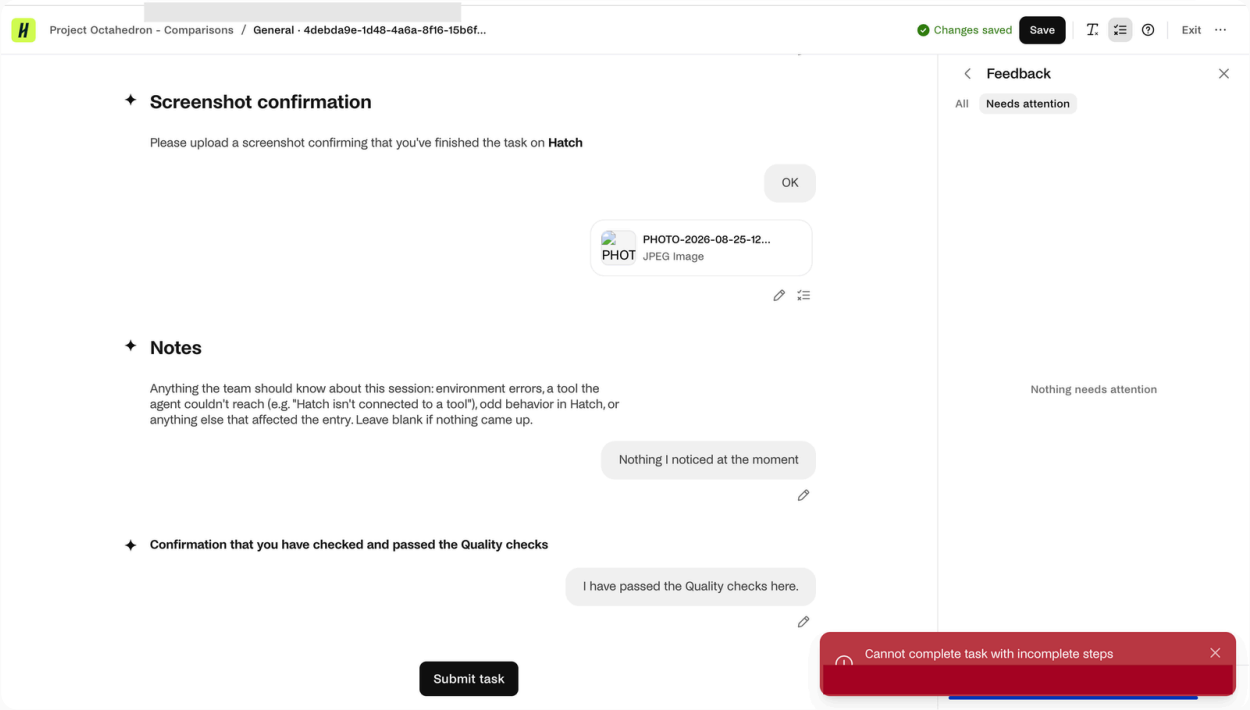

Run the two-minute check, then submit.

HAI stops you from submitting when a required step is empty or not valid. For example: an empty Notes box, a missing required screenshot field, a missing score or rationale, or a preference you never submitted in Hatch.

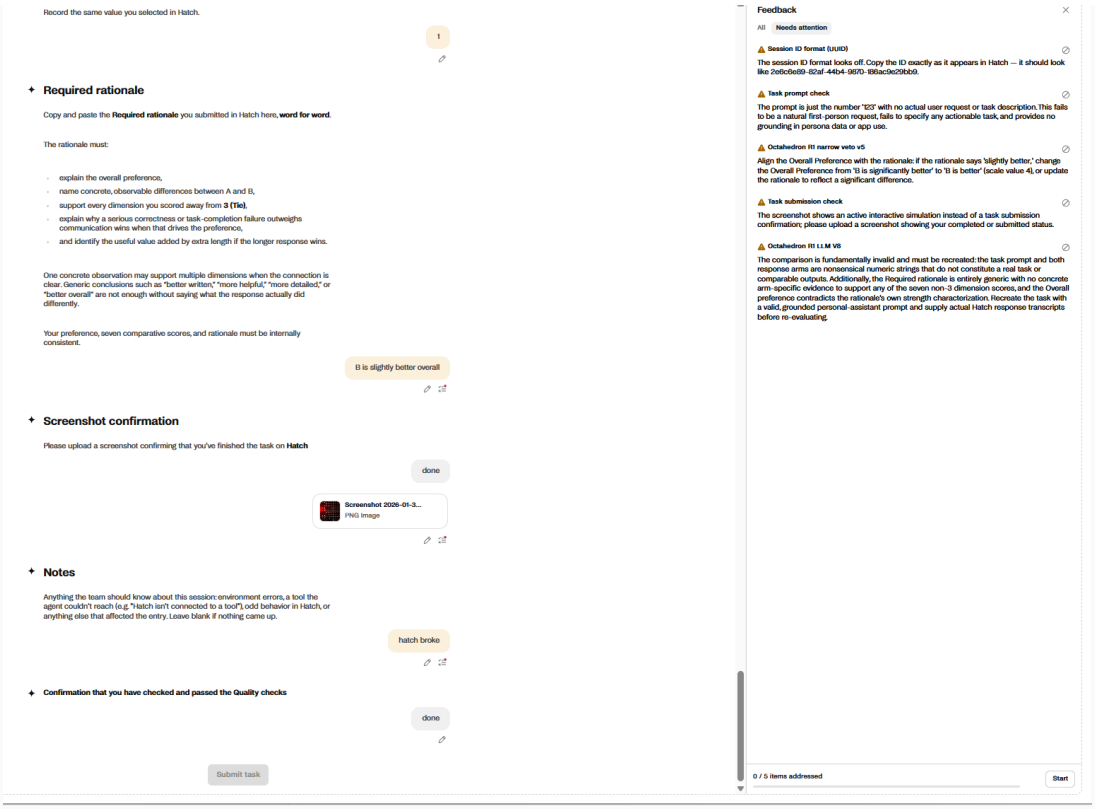

Keep fixing what the feedback panel shows until it says **Nothing needs attention**. That message - not your own feeling that you are done - is what lets you submit.

You get a warning when:

- the rationale does not explain a dimension's score, including a tie;
- all eight dimensions are 3 while your Preference favours one arm (and a Tie is not allowed, so find the difference);
- you chose "significantly better" when the difference is tiny;
- the rationale praises the arm that your scores went against; or
- what you wrote mentions a failed or missing reply.

Warnings go away once you fix what you wrote. A missing reply never goes away. Help: Complete the form and the step-by-step triage (deciding what to do first) on When Hatch breaks.

Never submit an incomplete comparison

Stop if either arm is missing, failed, cut off, or did not get all your user turns. Do not score it, and do not explain it in Notes. Create the session again. When Hatch breaks shows you what to do in each case.

Next: do the Two-minute check before you submit. Keep Live tasking open while you work.

Live tasking

Keep this page open in a second tab while you do the task. It has five short checklists, then a tool that checks your answers before you submit.

Your rationale is written in English. Always.

The Hatch conversation is in your language. Everything you write yourself in the form — the **Required rationale** and any notes — is in **English**. The rationale covers the Preference, the **Absolute quality**, and **the dimensions where something stood out** - lead with what decided the pick, do not restate every rating, and write more than five sentences. When the language itself drove a score — register, idiom, honorifics, script, code-mixing, a local expression — **quote the exact words in the original language and explain in English what a native speaker reads into them**, as the example rationales illustrate. A rationale in another language, or one that only restates the scores, is sent back.

Three things fail a task before quality is even judged

These three problems fail a task straight away, however good your scores are. Both arms must get **the same single prompt**: one message you send, identical for Arm A and Arm B, with no follow-up messages. Both arms must produce a **complete user-facing response**: a full reply the person can read, not a cut-off or error-only reply. Nothing may be **reconstructed, copied between arms, or pasted from the wrong run**: do not rebuild a reply yourself, copy one arm's reply into the other, or paste text from a different session. If any of these breaks, stop and make a new session. See When Hatch breaks.

The order - HAI writes and checks, Hatch runs, HAI pays

HAI

1. HAI task claimed

You clicked Start task, so your paid time is running

HATCH

2. Hatch session linked

Named youralias_task_N, mode Preference (called GAIA PREFERENCE in HAI), the right universe, your protocol for this task

GATE

3. HAI prompt green

Do not continue until: Every prompt check passes before you open the scoring part

HATCH

4. Hatch responses complete

Both arms finished, got the same single prompt with no follow-ups, and nothing was rebuilt by hand

GATE

5. HAI evaluation green (precommit check)

Do not continue until: Enter your Preference, Absolute quality, eight dimension scores and Required rationale in HAI while the Hatch

HATCH

6. Submit preference, then End comparison

Click both, in that order, only once the precommit check above is green

comparison is still editable. Fix anything flagged and rerun this check until it is green

GATE

7. The exact session shows completed

Do not continue until: Match it by name and UUID, not the row next to it - this is the final completion check, separate from step 5's precommit check

HAI

8. Confirmed screenshot uploaded

One image proving the exact comparison is finished - completed status and matching UUID

HAI

9. Required Notes complete

Required English text: N/A or None if nothing happened, otherwise what really happened

GATE

10. Not ended mid-annotation

Do not continue until: The session must not say "Ended mid-annotation"

HAI

11. Session UUID and attestation complete

Copy the UUID from Hatch, and answer the confirmation question honestly - type Okay when the task is truthfully complete

HAI

12. HAI task submitted

Submit only after every step above is done

A *gate* (the **GATE** rows above) is a point you cannot pass until the check is met. A *UUID* is the long ID code Hatch gives each session. For example, it looks something like `3f2a9c1e-…`.

Working session name

`youralias_task_N`

Copy

Your exact Slack alias in lowercase, then the task number.

Abandoned session name

`youralias_abandonedtask_N`

Copy

Use the same task number as the run that failed. Never submit this one.

Language tasks - the client's four rules

Your protocol for this task is **Hatch RM Style Task — Multilingual v1** (the dropdown's revision badge for it currently reads **Published v2** - that is the revision, not a different protocol name). On top of that:

Pick your locale's universe. Type your locale code (fr_ca, es_mx, pt_br_sp, ja_jp, en_in, hi_in_dl, bn_in_wb, mr_in_mh, te_in_ap, ta_in_tn, gu_in_gj, ml_in_kl, zh_sg, ms_sg, ta_sg, hi_sg or bn_sg) in Hatch's universe picker and choose one of the universes listed on your task. Never a universe from another locale, even in the same language. Chinese (zh_sg) and Malay (ms_sg) are new languages of the project. SINGAPORE TAMIL, HINDI AND BENGALI ARE SEPARATE ROLES from their Indian counterparts: same language, different country, different universes (ta_sg, hi_sg, bn_sg instead of ta_in_tn, hi_in_dl, bn_in_wb). Your task tells you which country you are assigned to; never use the other country's universes.

Talk to Hatch in that language, as the persona would. Natural mixing is fine (romanized Hindi with English, Québécois French, Tanglish). Never translate an English prompt word

for word. The one exception is English (India) (en_in): there, English is the assigned task language itself, so writing naturally in English, the way that persona would, is correct. **Judge as a native speaker.** Natural, or does it read like a translation? Right register (tu/vous, aap/tum, Japanese politeness levels)? A formal reply is not automatically cold where formality is normal. Right script and the user's language? Answering in another language or script without a reason is a fault; matching the persona's own language mixing is not. Names, dates, currencies, addresses and holidays handled the local way? **Write your rationale in English: more than five sentences, on the dimensions that mattered.** Quote the exact original words whenever the language drove a score, in quotation marks, and explain in English what a native speaker reads into them.

1. Setup

Before you start, check these settings in Hatch. Getting them right takes thirty seconds and saves you from a rejected task.

Thirty seconds here saves you from a rejected submission.

Before you create the session

0 of 5 complete

- [ ] The mode is **Preference** (called **GAIA PREFERENCE** in HAI). It is not GAIA RUBRICS.
- [ ] It is one of the universes listed on your task. Type your locale code (for example `fr_ca`) in the universe picker, and never pick a universe from another locale, even in the same language (`ta_in_tn` is not `ta_sg`).
- [ ] The protocol is **Hatch RM Style Task — Multilingual v1**, as shown on the task form. Its separate revision badge in the dropdown currently reads **Published v2** - that is the revision number, not a reason to pick a different protocol.
- [ ] The session name is `youralias_task_N`: your Slack alias, in lowercase, with no spaces. The session name and the session **ID** (a UUID, a long code) are two different things.
- [ ] You read the guidelines pop-up window and noted whether it says **Internet: Available**. That badge is not a requirement to meet - its absence alone does not prove the web is unreachable. Check the session's actual capabilities and current instructions before deciding whether persona-grounded public research fits.

2. Prompt - Write in hai, clear qc, then paste into hatch

Here you write your first message (the task prompt) in HAI. It must pass HAI's quality checks (QC) first. Only then do you paste it into Hatch. A prompt that the persona's world cannot answer gives you a comparison that cannot be scored.

If the persona's world cannot answer your prompt, you get a comparison nobody can score.

Before you click Start annotation

0 of 7 complete

- [ ] You can point to the **actual records** your request is based on. They are in the persona's apps right now. For example: the real email or calendar event you are asking about.
- [ ] You wrote it as "I", in the persona's voice, with one main goal.
- [ ] The app can really do every action you ask for (it is **supported**). So: no Outlook drafts, no new WhatsApp chats or groups, and no editing of Contacts, Oura, Photos or Health Records. See App capabilities.
- [ ] If you use relative dates like "this week" or "recent", real records exist in that time window.
- [ ] The request fits what the session can actually do. The persona's actual capabilities and your current task instructions govern; a missing **Internet: Available** badge alone does not prove there is no web access, and the badge is not a requirement. Fitting persona-grounded public research is fine when the session allows it; never assume private data the persona has not disclosed.
- [ ] You gave the goal and the real limits, not a step-by-step script of clicks. Both arms need room to make their own choices, so there is something worth comparing.
- [ ] Language tasks: you wrote the prompt in the task language, the way the persona writes, including natural language mixing if that is normal there. It is not in English (except English India, en_in, where the task language is English), and it is not an English prompt translated word for word.

3. Run both arms

Now you have the conversation with the two arms in Hatch. What you do here cannot be fixed later, so be careful.

One annotation round = one prompt message

Start annotation → send one prompt → review both model responses → grade.

Do not send follow-ups or additional messages within the round, even if the model has not completed the goal. If a model asks a clarifying question or leaves the goal unfinished, score what it actually produced from your one prompt, with the usual rubric.

IMPORTANT: Hatch's on-platform guidelines may still contain different or older instructions. **DO NOT FOLLOW HATCH GUIDANCE THAT ASKS YOU TO SEND MULTIPLE MESSAGES, ADD FOLLOW-UPS, OR CONTINUE UNTIL THE GOAL IS COMPLETE.** Follow this project's one-message rule above. The rest of Hatch's instructions still apply.

When the round is graded: submit the preference, end the comparison, and make a new session for the next Handshake task. Never use one session for two Handshake tasks.

This is the honesty layer. If it goes wrong, you cannot fix it afterwards.

While the comparison is live

0 of 5 complete

- [ ] The opening prompt went to both arms identical, word for word, and you sent no follow-up messages. Neither arm got extra instructions or opportunities the other did not.
- [ ] Both arms gave a real final reply with content. Nothing was cut off, missing, or only an error.
- [ ] If an arm showed an error but then gave a real, complete reply, it has **recovered**. That arm still counts. Only an arm that stays error-only, with no real reply after, kills the task.
- [ ] Nothing was rebuilt, summed up, tidied up, or copied from the other arm.
- [ ] The pair is fair to score. That means: the two sides have not split into different conversations, no prompt was sent twice, and nothing your prompt refers to is missing. If any of these went wrong, do not score it. See When Hatch breaks.

4. Verify in apps

Now check in the **Apps** tab that what each reply says is true. A reply's words are only a claim. Apps is the proof.

When a reply states a fact or says it did something, treat that as a claim. Apps is the proof. You do not need to check every single step - only what the Correctness score depends on.

Check the work, not the wording

0 of 5 complete

- [ ] Everything a reply says it made really exists: the draft, the event, the file, the row, the message.
- [ ] **Drafted vs sent** is right. If something was sent when it should only have been drafted (saved but not sent), that is a real failure, not a small note.
- [ ] The recipient, date, year, time, time zone, attendees and attachments match what you asked for.
- [ ] Nothing extra happened: no extra CC or BCC, no added attendees, no unrelated changes or deletions.
- [ ] **Apps Utilized** lists every app that *either* arm really used, put together. Include apps the arm only read from. Do not include apps that were only mentioned or only available. For example: if A used Gmail and B used Gmail and Calendar, list Gmail and Calendar.

5. Score in hai, clear qc, submit in hatch, then verify and get paid

Now you score the two replies, pass the quality checks, submit in Hatch, check the result, and get paid.

Score first. Then run the consistency check below.

Before you click Submit preference

0 of 9 complete

- [ ] You scored each dimension on its own proof. The eight sliders are **not votes** for the reply you liked best overall.
- [ ] Do not give a 3 (Tie) on a dimension about how the reply talks unless neither arm has a meaningful advantage on it - not merely that they are close. Correctness is the one dimension where a 3 is common.
- [ ] Style and behavior is about **how the reply communicates**. Correctness is about **facts and actions you checked**. Do not use one dimension's proof to score the other.
- [ ] Length decided nothing. Longer does not mean more complete. Shorter does not mean cleaner.
- [ ] Your rationale names real differences that someone could check. And you made sure that every "only A did X" claim is not actually true of both arms.
- [ ] Language tasks: you judged the replies as a native speaker. Natural or translation-sounding? Right politeness level? The user's language and script? Names, dates, currencies, addresses and holidays done the local way?
- [ ] Your Preference is A or B, never a Tie (Hatch shows a Tie button; never use it). You rated the **Absolute quality** of the preferred response (**Perfect**, **Good** or **Bad**) in Hatch - this applies to every locale, including English (India) - and you will record the same value in HAI.
- [ ] Your whole rationale is in English: the overall preference, the dimensions where something stood out, and the Absolute quality with its reason - more than five sentences, none of them a mere restatement of a score. Every language point quotes the exact original words, in quotation marks, and explains in English what a native speaker reads into them.
- [ ] While Hatch was still editable, your evaluation and Required rationale were already entered in HAI and every blocking HAI precommit check was resolved. Only then did you click **Submit preference** and **End comparison**, confirm the matching completed UUID, add the Confirmed screenshot, Notes and Okay, fix any final completion checks and submit in HAI. The values in HAI match the Hatch evaluation exactly.

Consistency check

This tool checks that your answers do not contradict each other. Type in what you are about to submit.

- **Basic check** reads your eight scores, your Preference and your rationale.
- **Deep check** also takes the prompt and both full conversations (*trajectories*). This lets it check your claims word by word against the two replies.

The results come in three levels:

- **STOP**: something makes your submission invalid, or makes it contradict itself.
- **REVIEW**: something about your scoring is worth a second look.
- **CLEAR**: nothing important is wrong.

It is fine for your sliders to point in different directions (some for A, some for B). That alone is never flagged.

Check my evaluation before I submit

Nothing here is saved or sent anywhere. It only reads what you type in.

Basic check | Deep check

Your scores, Preference and rationale. Finds places where your own answers contradict each other.

Eight dimensions (A compared with B) 1 = A significantly better · 3 = Tie · 5 = B significantly better

Style and behavior (High level) — Not scored

Correctness (High level) — Not scored

Style (Granular) — Not scored

Coherence & writing quality (Granular) — Not scored

Helpfulness (Granular) — Not scored

Completeness (Granular) — Not scored

Tone (Granular) — Not scored

Warmth (Granular) — Not scored

Overall Preference

A significantly better | A slightly better | Tie | B slightly better | B significantly better

Required rationale

Paste the rationale you are about to submit. Name the real differences between A and B that decided your Preference and moved your scores away from Tie. One real fact can back up several related dimensions - you do not need eight paragraphs.

A drafted the reply in Gmail with the correct recipient and the March 4 date from the invite; B sent it instead of drafting and dropped the attachment…

Proof list (optional)

+ Add claim

Write down up to four claims that decided your choice. This is not your rationale. It makes you look at your own proof one claim at a time.

Check my evaluation | Clear | Runs only in your browser.

What this cannot check

The tool looks for the exact same words. It cannot understand meaning. So if the other arm says the same fact in different words, the tool will miss it. When it is not sure about a match, it marks it for you to check by hand instead of failing it.

Before you claim a difference, look for the same thing in the other reply - or a word that means the same. We checked a set of confirmed failures by hand. In about 7 out of 10, the rationale misread or flipped something you could see in A or B.

Full definitions: The 2+6 dimensions and Score and choose. One last look before you submit: Two-minute check.

Previous | Next

Prompt builder

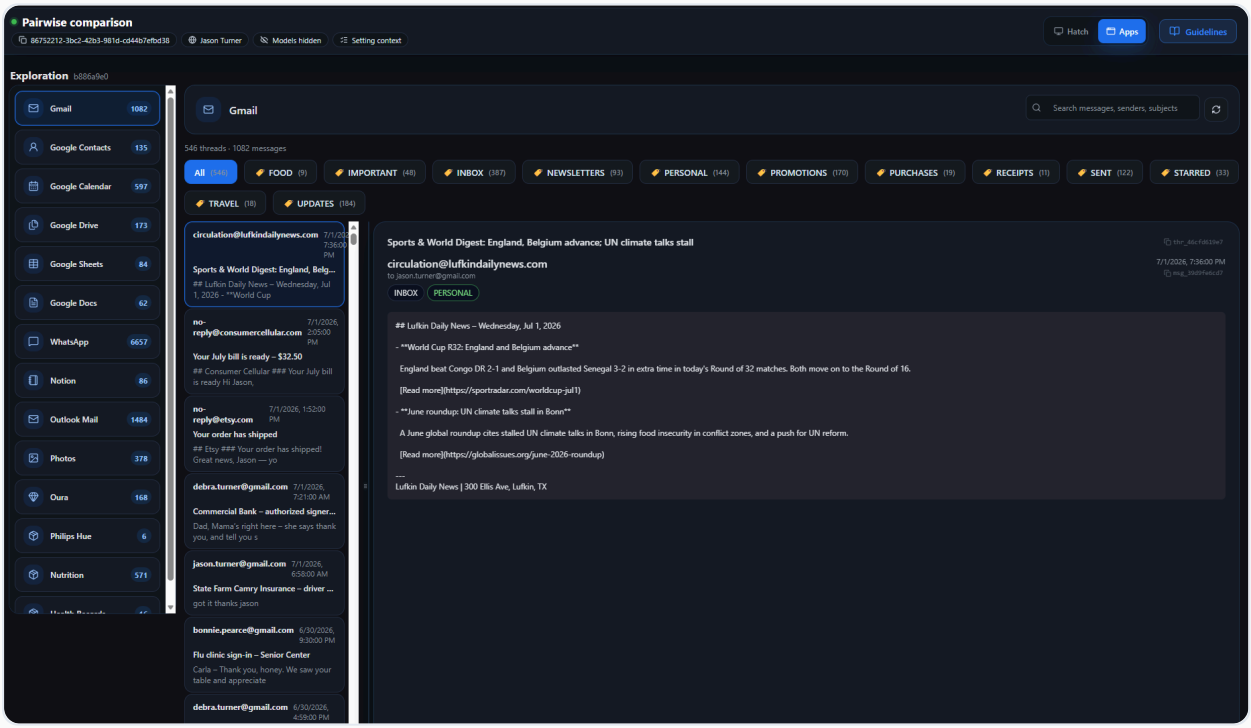

Step 3 - write the prompt in HAI and pass the prompt checks before Hatch ever sees it.

On this page you write your task prompt: your first message to the assistant, written as the persona. A bad prompt ruins the whole task, and good scoring later cannot save it.

There are four questions below. Answer them before you send anything. If your prompt fails one, rewrite it.

Explore the persona first

Before you write a word, look around the persona's world. Your prompt has to be built on things that are really there.

Click **Apps** in the top right and look through the persona's apps before you write the task.

- Click **Apps** in the top right.
- Look through the persona's apps before you write the task.
- Find the real emails, calendar events, messages, files, health records or other records that your prompt will be based on.
- Build your request from records that really exist.
- Do not make up any background.

Write in the script your universe uses

Open the persona's emails and chats before you write, and use the same script they use. The assistant answers in the script you write in, and a reply in the wrong script for that persona is a Style problem and a Bad on Absolute quality.

Hindi, Marathi, Bengali (India), Telugu, Tamil (India), Gujarati and Hindi (Singapore): Latin letters, the way people type on WhatsApp, with English mixed in where that is natural. For example: "yaar is mahine thoda tight lag raha hai paise ke maamle me".
Malayalam: Latin letters the same way; the persona's emails sometimes carry a little Malayalam script, so follow what they wrote.
Tamil (Singapore): a mix. Emails lean to Tamil script, WhatsApp chats lean to Latin letters; follow the persona's own messages.
Bengali (Singapore): a mix leaning to Bengali script, with Latin letters and English mixed in; follow the persona's own messages.
Japanese and Mandarin: their own script.
Malay, French, Spanish, Portuguese and Indian English: Latin letters, as always.

Check your prompt

1. Is it grounded?

Is the prompt based on a real email, event, message, document, contact, payment or health record in the persona's accounts? (*Grounded* means based on something that really exists in the persona's world.)

- Yes
- No

Check answer

Help for each question

Grounding - what counts

Build your request on emails, calendar events, chat messages, documents, contacts, payments or health records that exist in the persona's accounts. Usually use more than one, so the assistant has to connect them. For example: an email about a trip plus the calendar for that week.

Nothing made up. If you cannot point to the record, the prompt is not grounded.

Feasibility - the short version

- Gmail can draft and send.
- Calendar, Drive, Docs, Sheets and Notion can be changed (written to).
- WhatsApp can send messages only inside chats that already exist.
- Outlook Mail can send but cannot draft.
- Google Contacts and Oura can only be read.

Full table: App capabilities.

Common web-dependent prompts

These prompts need the web (the public internet) to answer:

- Current prices
- Current sold listings
- Current events
- Current restaurants
- Current trails
- Current weather
- Sports schedules
- Book-release dates
- Travel recommendations
- Live availability or current trends
- "Where should I go?" when it needs current public recommendations
- "What is popular right now?"

Sometimes one model searches the web when it did not need to. That does not make a good prompt bad. Just score that model's reply.

The valid middle ground

A good prompt is not too vague and not too step-by-step.

Too vague: *"Help me organize my life."*

Too mechanical: *"Open Sheet X and change B4 to $18."*

Better: *"Review my April expenses and update my budget tracker with anything missing."*

The thirteen use cases

A *use case* is the kind of thing the person wants help with. Pick it by the **goal, not the apps**. For example: *"move my Thursday run if it rains"* is Health & Fitness, even though the assistant changes the calendar.

Personal Productivity is no longer available. Do not use it.

Spread your tasks across the list. Companionship / Chat, Legal / Civic, Home Automation, Shopping, Entertainment and **Travel** have the fewest tasks so far. Pick one

of those when your task does not tell you which category to use.

Full table of what to talk about in each one: The thirteen use cases.

Most of what is new is conversation, not errands

In Companionship, Emotional Support, Entertainment and Media Creation, Hatch often has no work to do behind the scenes at all. Nothing gets booked, moved or looked up. **The reply is the whole task.** So what is left to judge is the language: the writing, the voice, how formal or casual it is, and the tone. You are not scoring whether the assistant is able to do things. You are scoring how it talks.

That does not mean the task is broken, and it is not a reason to skip it.

Conversation does not mean invented

Every prompt still has to be tied to this person's data. Emotional support about their day means something that is really on their calendar that day. Relationships means their real partner or friend - the one who lives in this world. There is always something for Hatch to look up.

A chatty prompt with nothing real behind it is still not grounded.

Date coverage

Does your prompt use **today, this week, this weekend, next week, current, upcoming, recent,** or **latest**? Then check that the persona's records really cover that time. The records stop at some date. An empty inbox or calendar after that date does not prove that nothing happened.

Use exact dates instead. For example: "during April 2026", "the week of March 9", "for the August 15 wedding".

One contrast per rule

Here is a good and a bad prompt for each rule.

Good

My saved concert emails have three shows I said I'd go to this spring. Put them on my calendar and flag the one that conflicts with the Hartford trip.

Bad

What concerts should I go to this month?

The good one can be answered from the inbox and calendar alone. The bad one needs today's public concert listings from the web.

Good

I told Alicia I'd do the 5k with her. Get it on my calendar with enough lead time to train.

Bad

Create a calendar event named "5k" on April 18 at 9:00am with a 30-minute reminder.

The good one leaves the assistant real choices to make. The bad one is just a list of orders to copy out.

Prompt ready

Tick every box before you use your prompt.

Write the prompt in your assigned locale's language, naturally the way the persona writes (English India writes naturally in English). Natural mixing of languages is fine where people really talk that way (romanized Hindi with English, Québécois French, Tanglish). Never translate an English prompt word for word.

Work through each item.

Checklist

0 of 8 complete

- [ ] Written as "I", in the persona's voice, naturally in your assigned locale's language as the persona would write it (English India writes in English) - not a word-for-word translation.
- [ ] Based on records that really exist.
- [ ] The assistant has to use the apps to do it.
- [ ] It can be answered from the persona's records, or from public research that actually fits the session's capabilities and current instructions - not from undisclosed private data.
- [ ] It only asks for actions the apps support.
- [ ] It is clear what "done" looks like.
- [ ] It does not dictate too many steps.
- [ ] The use-case category matches what the persona really wants, not the apps the task happens to use.

Next: check your request against App capabilities.

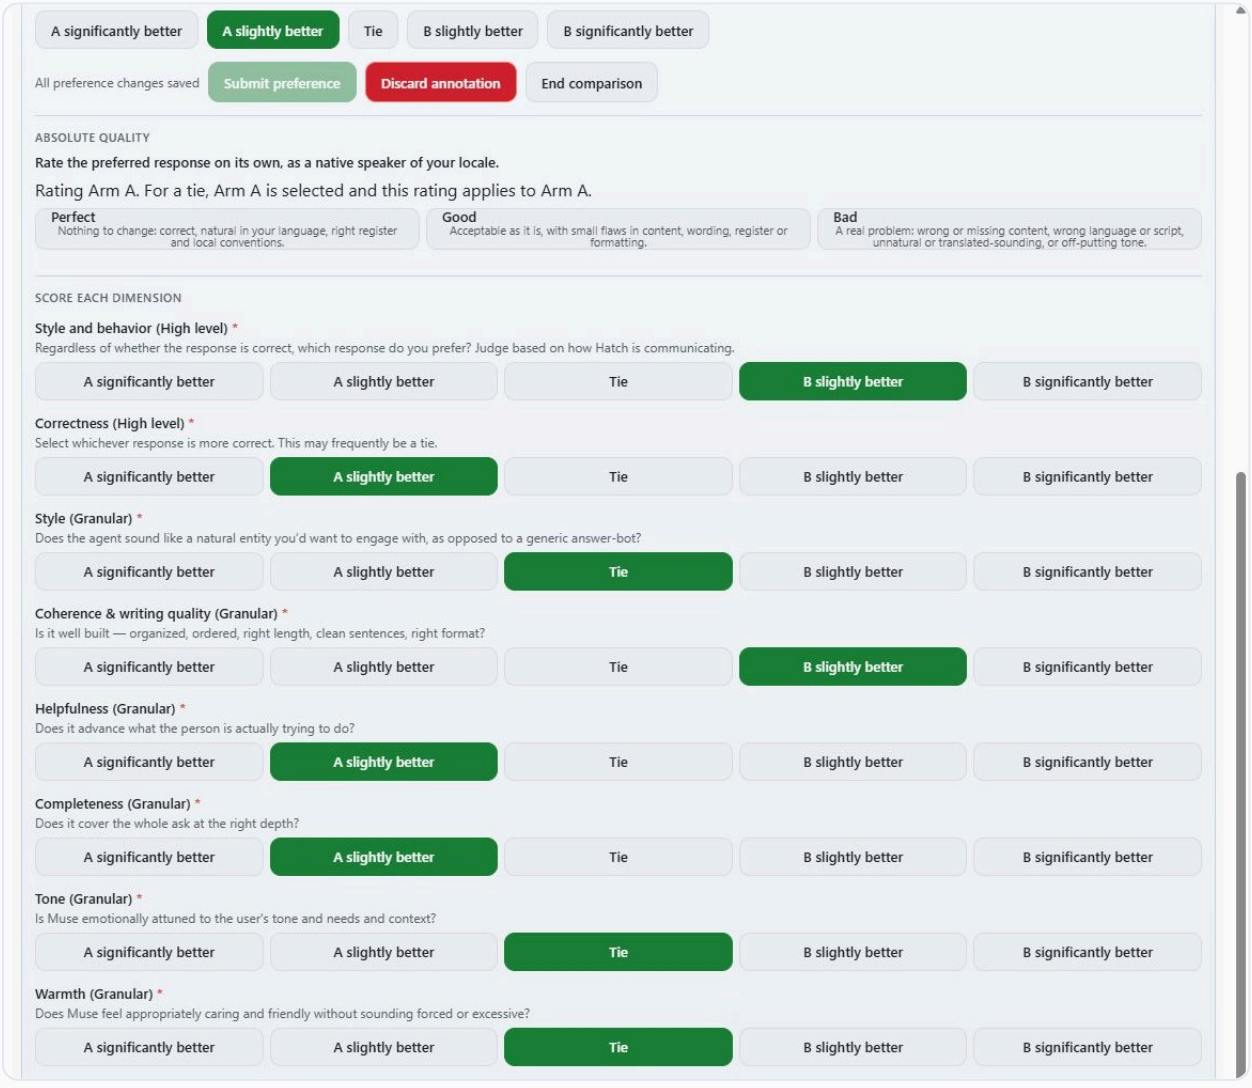

Previous Next

Attaching screenshots

What the three required image fields must each show, and when to take them.

HAI has **three separate image fields**. Each one proves a different thing. Do not reuse one image for another field, and do not merge them into one screenshot.

1. **Screenshot 1** - 1-2 images of the actual **Arm A and Arm B responses side by side**. They must be big enough that you can really read the text in each one. Do not shrink the window so far that the replies turn into grey lines.
2. **Screenshot scoring panel** - 1-5 readable images of the completed **"Pick the better response"** panel: the final, matching overall **Preference**, the **Absolute quality**, all **eight dimensions** answered - Style and behavior, Correctness, Style (Granular), Coherence & writing quality, Helpfulness, Completeness, Tone, Warmth - and the **Required rationale** box filled in.
3. **Confirmed screenshot** - exactly **1** image proving the exact Hatch comparison is finished: it must show the **completed** status and the matching session **UUID**. A filled-in but unsubmitted scoring panel, or the sessions dashboard, does not prove this.

Example - the scoring panel, with all eight dimensions and the Required rationale, which you fill in before you take this screenshot.

When to take each one

Take each screenshot only when what it must show is actually true

Screenshot 1 can be taken once both arms have given their real, complete replies.

Screenshot scoring panel: never capture an empty or half-filled panel. Answer every one of the eight dimensions, set the **Absolute quality**, and write the **Required rationale** first, then take this screenshot.

Confirmed screenshot: take this last, after you click **Submit preference** and then **End comparison** in Hatch - never before. Follow the order on The 11 steps: evaluate in HAI while the comparison is still editable, pass the precommit quality checks, fix anything flagged and rerun them, then submit the preference, then end the comparison, and only then capture the Confirmed screenshot. See Score and choose and Complete the form.

Why it matters

You are the one who must verify that your Confirmed screenshot shows the **exact completed session** for your task - matched by the session **name** and by the session **UUID** (the session ID). HAI's QC check reviews the evidence you submit; it does not reach into Hatch to fetch or re-check your live session for you. A row next to yours that also looks finished does not count. Neither does an earlier moment of your own work.

These are not proof of completion: a dashboard view, a **Stopped session** row, or the form you were still filling in. If you moved to a replacement session, take the Confirmed screenshot from the replacement. Then change both the session name and the UUID in your form to the replacement's - see When Hatch breaks.

The thirteen use cases

What each topic covers, which ones need more tasks, and how to pick the right one.

Every task belongs to one *use case*. A use case is the topic of the conversation: what the persona is trying to get done. Picking the right one keeps the work spread across all topics.

Pick by the **goal, not the apps**. For example: *"move my Thursday run if it rains"* is Health & Fitness. It edits the calendar, but the goal is the person's exercise.

- If your task names a category, use that one.
- If it does not, pick the category that matches what your persona is really trying to do.

Personal Productivity is no longer available

Do not use it. A task about the calendar or reminders belongs to the goal behind it:

moving a run is **Health & Fitness**;
preparing for a meeting is **Work Productivity / SMB**;
planning a trip is **Travel**.

The thirteen categories

The table lists each category and the kind of thing to talk about in it. ("SMB" means small and medium-sized businesses.)

Use case	What to talk about
Companionship / Chat	Just chatting: how your day went, your opinion on something, casual back-and-forth, catching up.
Learning / Research	"Explain how X works," researching the best options for Y, summarising something, help learning a skill.
Health & Fitness	Workouts, meal and nutrition ideas, tracking progress, sleep, general wellness questions.
Shopping	Finding a product, comparing options, recommendations for a purchase, deals, gift ideas.

Use case	What to talk about
Media Creation	Help creating something: writing a post or story, drafting a caption, brainstorming a creative project, an image idea.
Work Productivity / SMB	Drafting a work email or doc, planning a project, getting ready for a meeting, small-business tasks.
Entertainment	Recommendations for shows, movies, music, games; fun things to do; something to make you laugh.
Emotional Support	Talking through a stressful day, working through a feeling, encouragement, venting.
Finance	Budgeting, tracking expenses, a money question, planning a purchase.
Travel	Planning a trip, building an itinerary (a day-by-day trip plan), destination or restaurant ideas, packing help.
Relationships	Advice about a friend, partner, or family member; help wording a hard message; planning something for someone.
Legal / Civic	Understanding a rule or process, a question about government or public services, help making sense of a form or document - general information, not formal legal advice.
Home Automation	Controlling smart-home devices, setting up a routine, fixing a device that is not working.

Spread your tasks across the list

The client needs examples from every category. Some categories have far fewer tasks than others, so they need your help most.

Reach for the thinnest categories first

Some categories already have lots of tasks. Some have very few. The ones with the fewest ("thinnest") are **Companionship / Chat, Legal / Civic, Home Automation, Shopping, Entertainment** and **Travel**.

When your task does not name a category, pick one of those before you repeat a category you have already done.

Six categories are new: **Companionship / Chat, Media Creation, Entertainment, Emotional Support, Legal / Civic** and **Home Automation**.

Most of what is new is conversation, not errands

In many of the new categories, the assistant does not run errands for the person. It just talks with them. That changes what you judge.

The reply is the whole task

In Companionship, Emotional Support, Entertainment and Media Creation, Hatch often has no work to do behind the scenes at all. Nothing gets booked, moved, or looked up.

What is left to judge is the language: the writing, the voice, the register (how formal or casual it is), and the tone. You are not scoring whether the assistant is able to do things. You are scoring how it talks.

That does not mean the task is broken. It is not a reason to skip.

Conversation does not mean invented

Every prompt must still be *grounded*: based on something that really exists in this person's data.

Emotional support about their day means something that is really on their calendar that day.
Relationships means their real partner or friend - the one who lives in this environment.
There is always something for Hatch to fetch.

A chatty prompt with nothing real behind it is still an ungrounded prompt.

Good

Rough day - the Fenwick review got pushed again and I still have that Thursday dinner with Priya. Talk me through it.

Bad

I had a rough day, cheer me up.

Companionship / Chat - casual is fine, but it must point at something real. The good version mentions a real calendar event and a real person in the persona's world.

Write the prompt itself on Write the prompt. Record the category on Complete the form.

App capabilities

Use this page while you write the prompt, and again while you check what the replies say they did.

This page shows what the assistant can and cannot do in the persona's apps. You need it twice: when you write your prompt, and when you check a reply's claims.

- Use one of the universes listed on your task, for your assigned language and country. Its records are written the way people in that country write.
- In Hatch, the version comes from the **Universe** you pick, not from the version label of the protocol.
- The main set of apps below is the same in every persona version. V2 just adds a few more apps.
- If your prompt asks for something the app cannot do, your prompt is invalid.
- If a model *claims* it did something the app cannot do, it loses on Correctness.

Some tasks have no app work at all

Several use cases are conversations, not errands: Companionship / Chat, Emotional Support, Entertainment and Media Creation. In those, Hatch may not need to open any app, and neither arm will show any app activity. That is normal. Judge the language. In **Apps utilized**, list only what the arms really used - which may be very little or nothing.

The prompt still has to be grounded in the persona's records (based on things that really exist there) - see Write the prompt.

In the table below, *Read* means the assistant can look at the data. *Create / edit* means it can make or change things. *Send* means it can send messages to other people.

App	Read	Create / edit	Send	Important considerations
Gmail	Yes	Yes, real drafts	Yes	If you asked for a Gmail draft, text shown only in the chat does not count.
Google Calendar	Yes	Yes, events and reminders	n/a	Check the date, year, time zone, whether it is all-day, and the attendees.

App	Read	Create / edit	Send	Important considerations
Google Contacts	Yes	No	No	Cannot create, edit, delete, merge or remove duplicate contacts.
WhatsApp	Yes	No	Only with contacts who are already there	Cannot create groups, add members or change chats.
Outlook Mail	Yes	No	Yes	Cannot create drafts, move mail or change mail.
Google Drive	Yes	Yes	n/a	Check in Hatch that the file exists.
Google Docs	Yes	Yes	n/a	Check what the document says in Hatch.
Google Sheets	Yes	Yes	n/a	Check the rows and values in Hatch.
Notion	Yes	Yes	n/a	Check the page in Hatch.
Oura	Yes	No	n/a	Sleep records use the date the person woke up.

Never ask for these

Send a WhatsApp message to someone the persona has never messaged before
Merge Google Contacts
Create an Outlook draft
Any prompt that asks for one of these is invalid. Rewrite it so it asks for a summary, or for text the user can copy.

Details per app

Gmail - draft versus text

- "Draft a Gmail response" means a real draft saved in Gmail. Text in the chat alone does not finish the job.
- "Write a response to this email" is done if the reply gives the text of a draft - unless the prompt asks for a Gmail draft by name.
- Sending is not drafting. If you asked for a draft and the model sent the email, it clearly failed to follow your instructions.

Google Calendar

The assistant can create and change events and reminders. Before you score, check the date, the year, the time zone, whether it is all-day, and the list of attendees. If it added attendees you did not ask for, it did not follow your instructions.

WhatsApp - read and limited send

The assistant can read, search and sum up chats. It can find people, decisions and plans in them. It can send messages, but only to a contact the persona has already messaged.

It cannot create groups, add members or change chats.

Valid: "Summarize what the hiking group decided and write a message I can copy." **Valid:** "Send Claire a message confirming Saturday" - only if a chat with Claire already exists. **Invalid:** "Message this new number about the rental."

Google Contacts - read only

The assistant can search contacts and get saved details.

Valid: "Find Claire's current email address." **Invalid:** "Merge my duplicate contacts."

Outlook Mail - read and send, no drafts

The assistant can read and search mail. It can send messages. It cannot create drafts, and it cannot move or change mail that is already there.

Valid: "Read Alicia's Outlook message and send her a reply confirming Thursday." **Valid:** "Read Alicia's Outlook message and write a reply I can paste." **Invalid:** "Create an Outlook draft."

Google Drive, Docs, Sheets, Notion

The assistant can create and change files, documents, spreadsheets and pages. Always check in Hatch that the thing really exists with the content you asked for. A reply that describes a document has not created one.

Oura - read only

The assistant can read and study health data. It can never write it.

The wake-date rule: the date on each row is the day the person woke up. For example: "the night of March 14" is on the row dated March 15.

V2 environments

Your actual Hatch session and the universe your task lists govern which apps you have - not a fixed project-wide version. The table above is the common base available everywhere. Some sessions additionally carry the V2 apps described below; whether yours does depends on your task's setup, so check your own session before assuming any of them apply.

System-clock behavior in Hatch

This is how we have seen the Hatch setup behave.

The persona's world has its own pretend date. But when a model does something new, Hatch uses the real clock of the system (the *system clock*), not the persona's pretend date. So the persona's records may be set in a different date or time than the clock Hatch uses for new actions.

This can affect any record that is newly made or changed, anywhere dates, times or the order of things matter. Do not assume that the persona's "today" is the date Hatch will put on a new action.

Slack shows this most clearly. Slack lists messages in time order. So a new Slack message can show up in the middle of the persona's old pretend messages instead of at the bottom. The message was still sent. Its system-clock time just put it earlier in the list.

When you score actions where time matters, check the actual record that was made or changed in Hatch. Do not judge only by where it shows up on screen.

V2 Train and V2 Eval

These setups have the full set of apps. Every app in the table above is still there. The apps below are the additions.

App	Read	Write	Important considerations
Photos	Yes	No	Can search and look at existing photos. Cannot add, edit or delete photos.
Oura	Yes	No	The Oura guidance elsewhere on this site still applies.
Philips Hue	Yes	Yes	Can read and change devices that are already in the persona's setup - for example, turning an existing light on or off. Cannot add or create a new Hue device. Writes never create new devices or other new things.
Nutrition	Yes	Yes	Can read nutrition data, and can create and delete entries in the food log.
Health Records	Yes	No	Reached through HealthEx. Can read health summaries and existing conditions, medicines, lab results, vital signs, vaccinations, procedures, visits and notes. We have not seen it create, change or delete anything.
Instagram	-	-	New in the **Apps utilized** list. We have not yet mapped what it can read or write: select it whenever the Hatch trajectory shows that either arm used it, and check in Apps what it actually did.

V2 Professional Eval

Professional Eval has apps that are more about work. Only the apps below are confirmed for it. Do not assume an app from V2 Train or V2 Eval is here unless it is listed.

App	Read	Write	Important considerations
Slack	Yes	Yes	Slack makes Hatch's system-clock behavior easy to see; see the system-clock note on this page.
Linear	Yes	Yes	-

Before you score a write action

A *write action* is anything the assistant made, changed or sent. Check these before you score it.

Work through each item.

Checklist

0 of 5 complete

- [ ] The action really happened in Hatch, not just in the reply's last message.
- [ ] It has the content you asked for.
- [ ] It happened in the app the user asked for.
- [ ] Nothing extra was added - no attendees, recipients or CC you did not ask for.
- [ ] Dates, times and time zones are right, and no year was made up.

Next: Score and choose.

Previous | Next

Score and choose

Steps 6–7 - your Preference, the Absolute quality, the eight dimension scores, and the Required rationale in HAI.

Your rationale is written in English. Always.

The Hatch conversation is in your language. Everything you write yourself in the form — the **Required rationale** and any notes — is in **English**. The rationale covers the Preference, the **Absolute quality**, and **the dimensions where something stood out** - lead with what decided the pick, do not restate every rating, and write more than five sentences. When the language itself drove a score — register, idiom, honorifics, script, code-mixing, a local expression — **quote the exact words in the original language and explain in English what a native speaker reads into them**, like the example rationales. A rationale in another language, or one that only restates the scores, is sent back.

Practise this before your next task

Quality checks puts three things in one place: the hard rules, the app matrix, and the screenshot rules. It also links to the live practice page. There you can write a task prompt, record a judgment, and get rehearsal feedback from the same kind of checks - the actual HAI QC and reviewer acceptance still run on your real task's evidence and schema.

This page shows you how to record your judgment. Hatch asks you for these things:

- one **Preference** (your overall pick: A or B. Ties are not allowed);
- one **Absolute quality** (how good the preferred reply is on its own: **Perfect**, **Good** or **Bad**);
- eight **comparative dimension scores** (one score for each of the eight things you compare);
- one **Required rationale** (your written reason, always in English).

What you judge is how Hatch talks. The goal is that it sounds human: a real AI companion, not an answer-bot (a robotic machine that just spits out answers). Correctness still counts. When Hatch does something or states a fact from the person's world, you still check it against the environment (the persona's apps and data). But the main judgment is about the language.

Every dimension uses the same comparative scale. "Comparative" means you never give A its own grade and B its own grade. Instead, you say which arm was better on that dimension, and by how much.

Keep the live tasking page open

Live tasking has a checklist for each step. It also has a consistency check: before you submit, it tests whether your eight scores, your Preference and your Required rationale all agree.

The scale - one value per dimension

1 = A significantly better · 2 = A slightly better · 3 = Tie · 4 = B slightly better · 5 = B significantly better

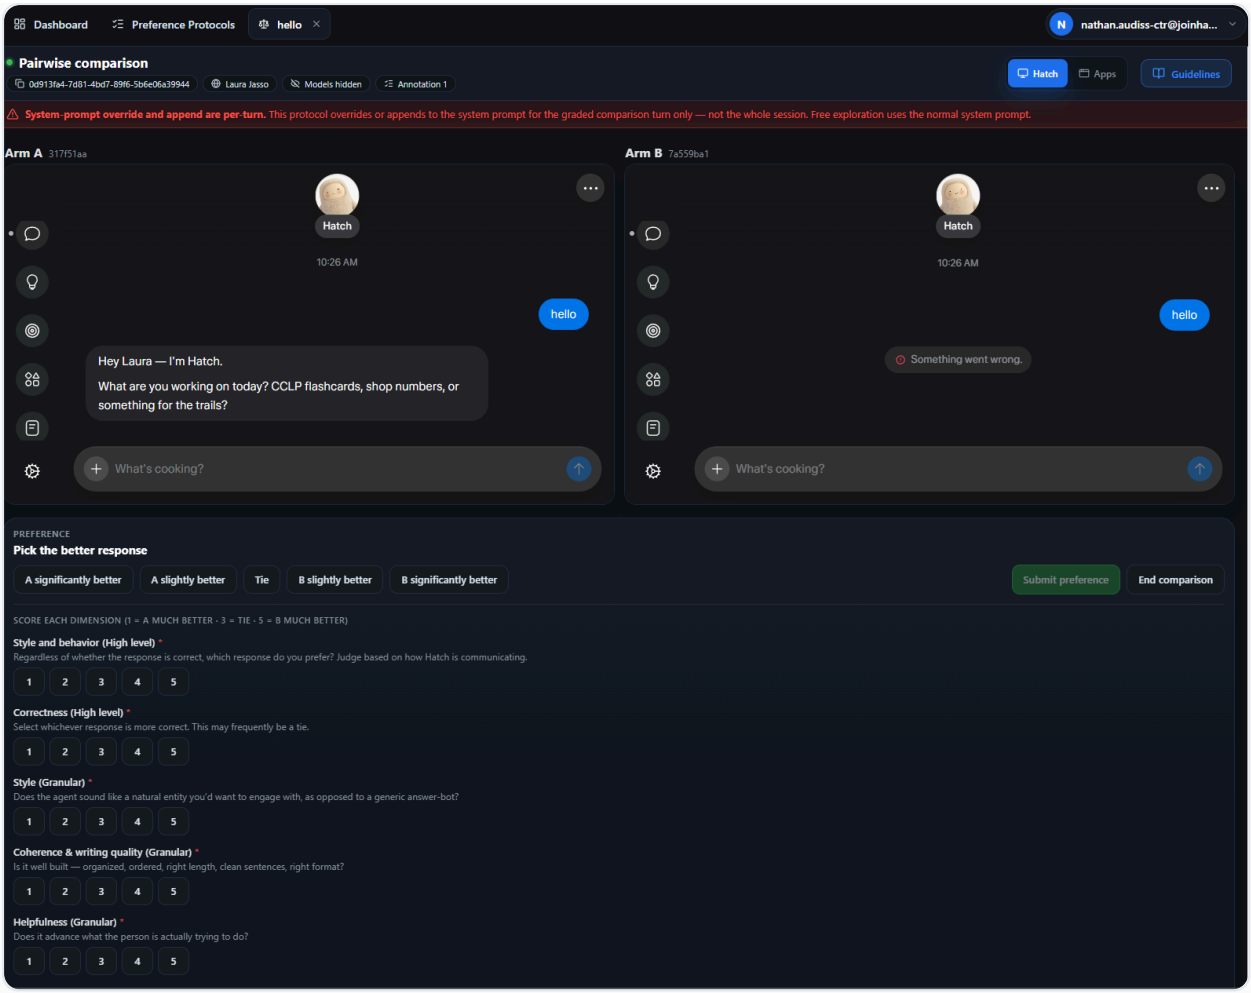

Low numbers favour Arm A. High numbers favour Arm B. **3 is Tie.**

3 means neither has a meaningful advantage

A 3 means neither reply has a meaningful advantage on that dimension - not that you could not be bothered to pick one. On the six communication dimensions the two arms usually do differ somehow, so look hard before you settle on a 3. On Correctness, a genuine tie is common: the two arms often do the same correct work.

A 3 should never be a default. "A slightly better" is a real answer when there is a real, even if small, difference; a 3 is only for when there genuinely is not one. If the replies are *close, but one is a bit better*, the scale already has a setting for that: a 2 or a 4.

Both weak. Still pick the one you prefer, and say why.
Both strong. Look again for the small thing that tips it. There often is one.
Genuinely nothing to separate them? That is a real 3. Do not manufacture a difference just to avoid it.
Where a 3 is genuinely common: Correctness. Two replies are often equally correct on the facts, and then 3 is the right answer. The test is the same everywhere: score a 3 only when neither arm has a meaningful advantage on that dimension, not merely because they are close. On the communication dimensions an evidenced difference is more often present - but when it genuinely is not, 3 is still the right, honest answer.

Score all eight dimensions with 1 favoring A, 3 as Tie, and 5 favoring B, then choose the Preference, write the Required rationale, submit the preference, and end the comparison.

Do not score a failed arm

This screenshot shows an example of a failure. Do not score it.

If either live arm says "Something went wrong," is missing, or is cut off, stop. Retry the session, or create it again. Never submit an incomplete comparison. See When Hatch breaks.

When one arm says it cannot reach an app

Sometimes the two arms have unequal app or tool access. For example, one says "I don't have WhatsApp connected", even though WhatsApp is clearly there, while the other arm uses it. In that case, judge the **quality of the communication**, not the access advantage itself.

First, confirm a real gap. One arm explicitly reports an access, sign-in, connection or runtime limitation, and the other arm uses that same source. Different results alone do not prove an access gap.
The pair can still be scored. A substantive "I can't access WhatsApp" reply is valid comparison material. An arm that only shows an error, is blank, or is cut off, and does not recover, is not: skip the pair or create it again. See When Hatch breaks.
Judge what each arm does with what it has: clarity, honest disclosure of the limitation, useful next steps, organization, voice, tone and warmth. Either arm can communicate better - the arm with access does not win automatically.

Missing access is not a reason for a score. Do not use the access gap itself to move a dimension score away from 3 or to pick the Preference. A real factual error, a wrong action, or a rude reply can still justify a difference.
Do not force ties either. Base every score on an actual difference you can point to in the replies.

About the red RM Style banner

The red RM Style banner is just for your information. It is not an error. It changes the assistant's hidden instructions (its "system prompt") by replacing or adding to them. That change applies only to the graded comparison turn, not to the whole time you spend exploring freely.

The order you work in

Follow these steps in this order. Doing them out of order is the easiest way to end up with scores that do not match your real judgment.

1. **Complete the comparison**

   Make sure both arms finished, and that you sent both arms the same user messages. Check in **Apps** every fact or claimed action that your Correctness score depends on.

2. **Note the concrete differences**

   Before you pick any number, ask: what actually separates these two replies? Look at the opening line, the order, what got buried, the way of talking, a robotic habit, a missing piece. If you cannot name a difference, look again.

3. **Score all eight dimensions independently**

   Give one value each: 1 favours A, 3 is Tie, 5 favours B. Score each dimension on its own evidence, not as a vote for the arm you liked.

4. **Choose the overall Preference**

   A significantly better · A slightly better · B slightly better · B significantly better. Ties are not allowed: pick A or B, then rate that response's Absolute quality. Hatch shows a Tie button; never use it. The Preference is your main judgment, **not** the average of the eight numbers.

5. **Rate the Absolute quality**

   Rate the **preferred response** (the arm you picked) on its own: **Perfect**, **Good** or **Bad**. This applies on every locale this guide covers, including English (India).

6. **Write the Required rationale**

   Write it entirely in English. Explain your Preference, give explanation and evidence for the dimensions where something stood out - not a line for every rating - and explain the Absolute quality, on every locale this guide covers, including English (India).

7. **Resolve QC, then submit preference, end comparison, and finish in HAI**

   With the Hatch comparison still editable, enter your Preference, Absolute quality, eight dimension scores and Required rationale into HAI, and resolve any blocking HAI precommit QC. Only then click **Submit preference**, then **End comparison** in Hatch.

Verify the exact session shows **Completed** with the matching UUID, add the completion evidence, complete Notes, and type **Okay** once it is truthfully complete. Run (and fix) any remaining completion checks, then submit in HAI.

Overall preference

Score the eight dimensions first. Then set the Preference.

Why this order? If you pick the winner first and then move the sliders to match, your eight numbers become votes for your favourite, not real judgments. That is the easiest way to get this wrong.

The Preference is your main judgment. It is not the average of the eight numbers.

- A serious failure can outweigh several smaller wins in how a reply talks. Serious failures are: a correctness mistake, a made-up fact, an action nobody asked for, or missing work.
- When both arms did the actual work about equally well, the communication dimensions can fairly decide the Preference.
- **Ties are not allowed.** Hatch's Multilingual v1 protocol shows a Tie button, but you must not use it. Pick A or B, then rate that response's Absolute quality. If you can name the difference, that is your winner. If you really cannot, pick the one you would rather have received, and say why in the rationale.

Absolute quality

Hatch also asks how good the **preferred response** is on its own, not compared with the other one, on every task. You pick one of three values:

- **Perfect** - nothing to fix.
- **Good** - it does the job, with small faults.
- **Bad** - it has a real problem, even though you preferred it.

Preferred does not mean perfect. The better of two replies can still be Bad. Ties are not allowed: pick A or B, then rate that response's Absolute quality.

In the HAI form, **Absolute quality** comes right after Preference. Record the same value you chose in Hatch, for every locale, including English (India). Explain your rating, in English, in the Required rationale.

> **What the three values mean in practice**
> Hatch shows only the three labels. The short explanations above are a plain-words guide to help you choose; your rationale is what tells the reviewer why you picked the value.

The eight dimensions

High level

These two look at the whole reply at once.

1. Style and behavior (High level)

"Regardless of whether the response is correct, which response do you prefer? Judge based on how Hatch is communicating."

This dimension ignores correctness on purpose. Judge only how the reply communicates.

It is the big-picture view of all six granular (detailed) dimensions at once. The full definition, and how it relates to the six, is on The 2+6 dimensions.

---

2. Correctness (High level)

"Select whichever response is more correct. This may frequently be a tie."

This covers checked facts, dates, recipients, artifacts (things the assistant made, like a draft or an event), and actions the reply says it took. When both arms did the same correct work, 3 is the right answer.

None of the six granular dimensions deals with correctness. This is the one place where facts are judged. The full definition is on The 2+6 dimensions.

Granular

"Granular" means detailed: each of these looks at one part of the reply. Each one asks one question, and only that question.

The full definitions are on **The 2+6 dimensions**. There you will find what each one covers, what it does not, and a good/bad example pair for each. Here is the short version:

Dimension	The one question it answers
Coherence & writing quality	Is it well built - organized, ordered, right length, clean sentences, right format?
Style	Does the agent sound like a natural entity you'd want to engage with, as opposed to a generic answer-bot?
Tone	Is Hatch emotionally attuned to the user's tone, needs, and context?
Helpfulness	Does it advance what the person is actually trying to do?
Completeness	Does it cover the whole ask at the right depth?

Dimension	The one question it answers
Warmth	Does Hatch feel appropriately caring and friendly without sounding forced or excessive?

Read the full definitions before your first task. Most disagreements happen because someone puts what they noticed under the wrong dimension. The table at the bottom of that page shows which dimension each kind of problem belongs to.

Language tasks - judge by local norms

Judge every dimension as a native speaker of the task's locale would:

Natural or translated? A reply that reads like a translation is a Coherence & writing quality and Style problem.
The right register for this person and situation (tu/vous, aap/tum, Japanese politeness levels). A formal reply is not automatically "cold" if formality is the local norm - this matters for Tone and Warmth.
The right script and the user's language. Answering in another language or script than the user's, without a reason, is a fault. Matching the persona's code-switching (natural mixing of languages) is not.
Local details. Names, dates, currencies, addresses and holidays should be handled the local way.
Robotic habits ("AI slop" tics) are judged by their local equivalents.

Score each dimension independently

"Independently" means each score stands on its own. One dimension does not decide another.

Work through each item.

Checklist

0 of 8 complete

- [ ] Score each dimension on its own evidence. Do not force all eight numbers to favour the same arm.
- [ ] A can be more correct while B communicates better. That is a normal, expected result.
- [ ] Style and behavior (High level) ignores correctness on purpose.
- [ ] Correctness (High level) may often be 3 / Tie.
- [ ] Completeness means covering everything asked, in enough detail. It is not about the number of words.

- [ ] Warmth is the amount of care and whether it fits the moment - too much gushing and coldness both lose. Tone is whether it read the room (picked up the mood of the moment).
- [ ] A 3 means neither arm has a meaningful advantage on that dimension. If you can see a real difference, score it 2 or 4 instead of defaulting to 3.
- [ ] Style and behavior points the same way as most of your six granular scores - or the rationale explains why it does not.

Length-bias calibration

People tend to favour longer replies, or sometimes shorter ones. Do not let length alone decide.

Longer is not better, and shorter is not better

Extra detail helps only when it gives useful information, a useful action, context, or a clearer layout.
These things can hurt **Style** or **Coherence & writing quality**: repetition, raw ID numbers, talk about the assistant's internal process, technical logs of what it did, and filler.
A short reply still loses when it leaves out work that was asked for, or when it is wrong. Good style never makes up for a wrong action, missing work, a claim with nothing to back it up, or a made-up fact.

Writing the required rationale

The rationale is your written reason. More than five complete sentences is the floor, and dense signal is the target: lead with what decided the pick, and do not restate every rating. It must:

Work through each item.

Checklist

0 of 8 complete

- [ ] Explain the overall Preference.
- [ ] Name concrete differences between A and B that someone could see for themselves.
- [ ] Give one or two sentences for each dimension where something stood out: say what A and B each did on it. Skip the dimensions with nothing to say rather than restating their ratings - a line that only repeats a score counts for nothing.
- [ ] When a serious correctness or unfinished-work failure decides the result, explain why it outweighs the communication wins.
- [ ] When the longer reply wins, explain what useful value the extra length added.

- [ ] State the Absolute quality you gave the preferred response and the reason. Good or Bad needs a named flaw; Perfect needs a sentence on why nothing is missing.
- [ ] Quote and explain the language - as if to an English speaker who does not know it. Whenever register, formality, idiom, honorifics, dialect, script, spelling, code-mixing or a cultural reference affected a score, quote the exact words in the original language, in quotation marks, then explain in English why they land that way and which arm got it right ("t'es correct" is how a Québécois friend says "you're fine"). "B sounds more natural" with no quoted word is not a reason.
- [ ] Write all of it in English. The reviewer may not speak your language: give them what they need to check your call.

One concrete observation can support several dimensions, as long as the link is clear, and you do not need a heading per dimension. But every dimension that influenced the pick gets its own sentence or two, and a dimension with nothing to say is left out rather than padded with a restated score. See the three example rationales for the shape.

Good

A gives one direct confirmation, while B includes message IDs, timestamps, and repeated process narration that make the result harder to scan and less natural.

Bad

A is better written and more helpful.

A general conclusion with nothing anyone can check supports nothing. Name what each arm actually said or did.

Good

B slightly better. A uses "vous" with the user's own sister, which sounds stiff and odd in Québec; B uses "tu" and writes "souper", as the persona does. Both moved the event correctly, so Correctness = 3. Absolute quality of B: Good - it writes the time as "6:40 PM" instead of the local "18 h 40".

Bad

B est meilleur, plus naturel.

Language task: the whole rationale is in English. The original words ("vous", "tu", "souper") are quoted in quotation marks, and the English around them explains why they matter.

Consistency examples

"Consistent" means your scores, Preference and rationale tell the same story. Here are good and bad examples.

Good

Correctness = 1 because A used the right calendar and the correct date while B created the event a day early. Style = 4 and Tone = 4 because B's message sounds like a person and A reads like a completion log. Overall A significantly better - the wrong date is not repaired by a friendlier voice.

Bad

A is more correct so everything favours A.

The dimensions can point in different directions. Score each one on its own evidence.

Good

Both arms drafted the same correct reply, so Correctness = 3. Coherence & writing quality = 4 because B's three-bullet confirmation covers the same ground without repeating the tool process; the reduced repetition is a coherence gain, not extra coverage, so Completeness = 3. Overall B slightly better.

Bad

B slightly better because it was shorter.

When both arms did the actual work equally well, the communication dimensions can decide the Preference. But say what made the communication better.

Good

B sounds more natural, so Style = 5 and Tone = 4. But the user asked for a draft and B sent the email, so Correctness = 1. Overall A significantly better - an unauthorized send outweighs the communication wins.

Bad

B significantly better because it was the more engaging response.

A serious failure on correctness, or on following the instructions, outweighs style.

Good

Correctness = 3 - both arms drafted the same reply to the same recipient with the same date. But A bolds only its section labels while B bolds nearly every clause, so Coherence & writing quality = 1, and B closes with "Want me to set a reminder?" so Style = 1. Overall A slightly better.

Bad

Correctness = 3, so Style = 3, Coherence = 3 and Tone = 3 as well. Preference Tie.

Correctness is often a tie. The communication dimensions almost never are. Two replies that look nothing alike cannot be a Tie on Style, Coherence and Tone just because the facts matched. And a Tie on the Preference is never allowed: pick A or B.

Final scoring checklist

Go through this list before you submit.

Work through each item.

Checklist

0 of 11 complete

- [ ] Both arms finished, both got the same user messages, and every fact and claimed action that Correctness depends on was checked in Apps.
- [ ] All eight dimension scores set before the Preference. The Preference is A or B, never a Tie.
- [ ] All eight dimensions scored, one value each.
- [ ] No 3 on a communication dimension unless neither arm has a meaningful advantage on it - not merely that they are close.
- [ ] The dimensions that mattered each have a sentence in the Required rationale, no line merely restates a rating, and the Absolute quality has a reason.
- [ ] Preference, scores, and rationale tell one story.
- [ ] A and B were not swapped - remember 1 favours A and 5 favours B.
- [ ] Length alone did not choose the winner.
- [ ] Absolute quality (Perfect, Good or Bad) set for the preferred response, on every locale this guide covers, including English (India).
- [ ] The Required rationale is entirely in English, and every language point quotes the original words and explains them.

- [ ] Blocking HAI precommit QC resolved while Hatch is still editable, then Submit preference clicked, then End comparison, then the completion checks run and fixed.

Next: read the full definitions on The 2+6 dimensions, then go to Complete the form.

Write the rationale

Step 7 - the Required rationale: in English, dense, on the dimensions that mattered, the language quoted and explained.

Your rationale is written in English. Always.

The Hatch conversation is in your language. Everything you write yourself in the form — the **Required rationale** and any notes — is in **English**. The rationale covers the Preference, the **Absolute quality**, and **the dimensions where something stood out** - lead with what decided the pick, do not restate every rating, and write more than five sentences. When the language itself drove a score — register, idiom, honorifics, script, code-mixing, a local expression — **quote the exact words in the original language and explain in English what a native speaker reads into them**, like the example rationales. A rationale in another language, or one that only restates the scores, is sent back.

Keep it dense, not long

The client reads hundreds of these and has told us what they value: **signal, not characters**. Lead with the one or two things that actually decided your Preference - the wrong fact, the register slip, the missing step - with the words quoted. Mention a dimension only when something stood out on it, and say **what differed**, not a restatement of the score you already gave ("Tone: B slightly better because B had the better tone" says nothing). Do not walk through all eight ratings one by one. Cut anything the reader can already see in your scores, and never repeat a point. A rationale still runs to more than five full sentences and still covers the Preference and the Absolute quality; it just spends those sentences where the signal is. A long rationale that repeats itself is sent back as readily as a thin one.

The rationale is the only part of the task a reviewer who does not speak your language can check. It is also the part most often sent back. This page shows the shape, three real rationales tightened to the dense rule, and the five reasons one comes back.

The shape

Copy the rationale you wrote in Hatch into the form **word for word**. Write it in this order:

1. **Preference and Absolute quality.** Which response wins, by how much, and the main reason. Then the Absolute quality of the winner (Perfect / Good / Bad) and why.
2. **The dimensions where something stood out.** For each one, one or two sentences on what A and B actually did there: the wrong fact, the register slip, the missing step, the tone that missed the moment. Skip the dimensions where nothing stood out - do not restate every rating. A genuine Tie needs no line unless the tie itself is the surprising part.
3. **The language, quoted and explained.** Whenever the words decided a score, quote them and explain them as if to an English speaker who does not know your language: what they mean, why they land that way, which arm got it right.

4. **The decisive dimensions.** Close by naming the one or two dimensions that actually drove the overall pick.

Work through each item.

Checklist

0 of 6 complete

- [ ] All of it is in English. You may occasionally keep a word of your own language for a nuance English cannot carry - quote it, then explain it.
- [ ] It opens with the Preference and the Absolute quality, and says why.
- [ ] Every dimension that influenced the pick has one or two sentences on what differed; the ones with nothing to say are left out, not padded.
- [ ] Every language point quotes the exact original words, in quotation marks, and explains them in English.
- [ ] It names concrete, observable differences - what each arm said or did - and it says why "slightly" rather than "significantly" (or the reverse).
- [ ] More than five complete sentences. The floor is there so the signal gets written down, not so it gets stretched: five or fewer come back, and so does padding.

Three rationales to copy

Written by fellows on real tasks before the dense rule, and tightened to it; what was cut is noted under each. The conversation is in the task language; **the rationale is in English**. They stay in English on every language version of this page: that is the point. Where original words are glossed in English, that gloss is a translation/paraphrase, not the original quotation itself.

1. French (Québec) - the shape to copy

Prompt (in French (Québec)): Check mes courriels pis dis moi si y'a du nouveau pour le poste de superviseur. J'veux pas avoir l'air trop pressé avec Denis, mais j'veux pas manquer de quoi non plus.

Preference: B is slightly better · **Absolute quality:** Good

Scores: Style and behavior B slightly better · Correctness Tie · Style B slightly better · Coherence & writing quality A slightly better · Helpfulness Tie · Completeness Tie · Tone B slightly better · Warmth B slightly better

Rationale (English):

> *Preference: B is slightly better than A. Absolute quality: Good. Both arms read the same two emails and report the facts correctly, so Correctness is a Tie; neither noticed Alexandre had already replied to Isabelle, hence Good, not Perfect. He had two worries, looking pushy and missing something ("J'veux pas avoir l'air trop pressé… mais j'veux pas*

> *manquer de quoi non plus"); B's closing "Pas besoin de le relancer, t'es correct" ("no need to chase him, you're fine") answers both in his own casual Québécois, A only the first ("t'as rien à relancer"). That line is why Tone and Warmth go to B. Style: B says "t'es correct", which is what we'd say here, while A's "jeter un œil" ("take a look") is neutral international French. B's "en lice" ("in the running") is a bit formal, hence only slightly. Coherence goes to A: "du nouveau d'aujourd'hui" is clunky.*

Why it works: it opens with the Preference and the Absolute quality, then spends its sentences on the one thing that decided the pick, B's closing line, quoted and glossed ("t'es correct" / "you're fine"), and says why that line carries Tone and Warmth too. Style gets its quotes ("jeter un œil" / "take a look"), it says why *slightly* ("en lice" is a bit formal), and Coherence goes honestly to A. The three genuine ties get no line. Eight sentences, and nothing the reader could already see in the scores. **What was cut:** the original had a line for every dimension, including three Tie lines and a Style-and-behavior line that repeated the opener.

2. Hindi - a Bad rating, and a register explained to a non-speaker

Prompt (in Hindi): yaar is mahine thoda tight lag raha hai paise ke maamle me... 28 hajar mein se Mummy ko 5000 bhejne hain mujhe, RD ki kisht bharni hai, darzi ka bill bhi pending hai, aur room ka kharcha bhi dena hai. Mujhe bohot chinta ho rahi hai yaar... sab manage ho payega ya nahi? agar nahi ho raha toh please batao kya aage piche khiska sakti hoon mai, bas RD miss nahi karni kyoki wo CIBIL ke liye zaroori hai! RD ki kisht kab tak jama karni hai woh bhi dekh ke reminder laga dena. Aur iss sab ke jawaab aur poore plan ka ek note bhi bana ke kahin rakh do taaki baar baar poochna na pade.

Preference: A is significantly better · **Absolute quality:** Bad

Scores: Style and behavior A slightly better · Correctness A slightly better · Style A slightly better · Coherence & writing quality B significantly better · Helpfulness A slightly better · Completeness A significantly better · Tone A slightly better · Warmth A slightly better

Rationale (English):

> *Preference: A is significantly better than B. Absolute quality: Bad. Both arms failed: neither opened Gmail, Docs, Notion, Calendar or Drive, both asked Pavneet for figures already in her "28k hisaab rough" doc (₹1,000 RD, ₹7,000 rent), and neither set the RD reminder; that is the Bad. A still delivered two of her four asks, B none: A created the "October Budget Plan" note it promised (it exists in Apps), B promised a plan and did nothing. A's note wrongly says a missed Post Office RD instalment hurts her CIBIL score, so Correctness is only slightly A. Register: Pavneet wrote in friendly "tum"; A keeps it, B slips into intimate "tu" ("wait", "don't stress", "tell me"), unearned for an assistant, and brushes off a user who said she was very worried with "don't stress" before seeing a number. That is why Style, Tone and Warmth go to A. Coherence goes to B: A is three stacked messages repeating "I understand", B one tidy reply.*

Why it works: the opener says what both arms failed to do and still ranks them, and that failure is what justifies the Bad. "Hindi has three forms of you: aap, tum, tu" is exactly how to explain a register to someone who does not speak the language, and it is said once, carrying Style, Tone and Warmth together. The one error in A's note is named, Coherence goes to B, and Helpfulness and Completeness are not restated: "two of her four asks against none"

already says it. **What was cut:** the original walked through all eight dimensions in eight paragraphs and made the "tum"/"tu" point three times.

3. Portuguese (Brazil) - the language explained, inside the shape

Prompt (in Portuguese (Brazil)): Eu quero saber como as noites do Davi têm impactado minha saúde e bem-estar. Você consegue montar um calendário no meu Notion mostrando o último mês e cruzando as notas que salvei no Notion das noites do Davi com as métricas do meu Oura? Gostaria de ver o que impacta mais positiva e negativamente o meu sono, minha disposição, meu estresse e resiliência e queria sua ajuda para traçar um plano de ação para otimizar minhas métricas de saúde no contexto do cuidado do Davi. Ele sempre vem primeiro, mas eu quero essa visualização para saber o que posso fazer por mim nesse período de adaptação, que não tem sido fácil

Preference: A is significantly better · **Absolute quality:** Good

Scores: Style and behavior A significantly better · Correctness A slightly better · Style A slightly better · Coherence & writing quality A significantly better · Helpfulness A significantly better · Completeness A significantly better · Tone A significantly better · Warmth A significantly better

Rationale (English):

> *Preference: A is significantly better than B. Absolute quality: Good. What decided it: A built the calendar that crosses Davi's nights in Notion with the Oura metrics and added a prioritised action plan with a checklist; B asked where the data was although the prompt said so, left the nights without notes unlinked, and its summary credits the shift swaps with Marina when those nights scored only 75–83 (15 and 23 Sep "adequate"), while the best nights were the 1–2-waking ones A names. That is Completeness, Helpfulness and Correctness to A. Coherence and Style: A writes the way a Brazilian talks, "Vou montar esse calendário e te trazer o que mais pesa no sono e um plano prático pra esse período" ("pra", not "para"), while B's closing reads like a translation ("O que mais te protegeu foi o revezamento em turnos com um bloco contínuo. Estresse alto no dia derrubou sono e disposição.") and leaves "restored", "strong/exceptional" and "stressful" in English. Tone and Warmth: the prompt ends on a plea ("que não tem sido fácil"); A answers it and says "fechado" like a friend would, B stays cold. Good, not Perfect: A also drops a few English words, just far fewer.*

Why it works

The language carries this one: "pra" instead of "para", "fechado", B's closing quoted and named as a translation, the English words B left untranslated. One quoted sentence per claim, and every quote does work; the Good is justified by a flaw A shares. What was cut: the original was two long paragraphs about the arms, close to 700 words, that made the same points under Tone, Warmth and Helpfulness in turn.

Weak and strong

Good

Style: B slightly better. B picks up his own style ("Je check tes courriels") and says "t'es correct", which is what we'd actually say here, while A's "jeter un œil" ("take a look") feels like neutral, international French. B's "en lice" ("in the running") is a bit formal, hence only slightly.

Bad

Style: B better, it sounds more natural and more Québécois.

Same judgment, same score. The weak version cannot be checked by anyone who does not speak French. The strong one quotes three expressions and says what each one means and why it matters.

Good

Correctness: Tie, as both state the same four facts accurately, and both miss that Alexandre had already replied.

Bad

Tone: B slightly better because B had the better tone. Warmth: B slightly better because B was warmer.

Restating a rating is not a reason. Either say what differed on that dimension, with the words, or leave the dimension out. Lines like these are padding, and padding is sent back.

The five reasons a rationale comes back

What the reviewer sees	What to do instead
A naturalness or register claim with no quoted words ("B sounds more natural")	Quote the exact words, in quotation marks, and explain them in English.
A line for every dimension that just restates its rating	Only the dimensions where something stood out, with what A and B actually did. Cut the rest.
The Absolute quality stated without a reason, or a Perfect on a reply the rationale criticises	Good or Bad needs a named flaw; Perfect needs a sentence on why nothing is missing.

What the reviewer sees	What to do instead
Part of the rationale in the task language	English. Keep an original word only to quote it, then explain it.
A claim the trace contradicts ("A created the event" when the Diff shows nothing)	Check Apps and the trace before you write it. The reviewer will.

The checklist for the whole evaluation is on Score and choose; where the rationale goes in the form is on Complete the form.

The 2+6 Dimensions

Two big-picture questions and six detailed ones. What each one covers, what it does not, and how they fit together.

Your rationale is written in English. Always.
The Hatch conversation is in your language. Everything you write yourself in the form — the **Required rationale** and any notes — is in **English**. The rationale covers the Preference, the **Absolute quality**, and **the dimensions where something stood out** - lead with what decided the pick, do not restate every rating, and write more than five sentences. When the language itself drove a score — register, idiom, honorifics, script, code-mixing, a local expression — **quote the exact words in the original language and explain in English what a native speaker reads into them**, like the example rationales. A rationale in another language, or one that only restates the scores, is sent back.

On this page you learn the eight things you compare between Arm A and Arm B. Each one is called a *dimension*. Knowing exactly what each one covers is what makes your scores fair and consistent.

This project judges language: how the assistant talks. The goal is that Hatch sounds human. It should feel like a real AI companion, not an answer-bot (a robotic machine that just spits out answers). Eight dimensions carry that judgment:

- **Two high-level ones.** These look at the whole reply at once.
- **Six granular ones.** "Granular" means detailed: each looks at one small part of the reply.

The six granular definitions below are the client's own words, from the shared current taxonomy. They are the reference you go back to. The two high-level ones are the whole-reply view of those six.

Each dimension asks one question, and only that question. Score each one on its own evidence, reasoned independently - the same exact line or quote from a reply can support more than one dimension at once, as long as each dimension's conclusion is reasoned separately from that evidence, not copied across.

For example: a beautifully built reply to the wrong question scores high on Coherence (it is well written) and low on Helpfulness (it does not help). That split is a correct result, not a mistake.

The two high-level dimensions

Hatch asks you these two first. In the client's guidance, each is a one-line question. Below is what each one covers, worked out from that guidance and from the live task.

Style and behavior (High level)

In plain words: forget for a moment whether the facts are right. Which reply would you rather get, based only on how it talks to you?

Regardless of whether the response is correct, which response do you prefer? Judge based on how Hatch is communicating.

Owns

The whole communication verdict - which reply you would rather have received, ignoring whether it is right. It is the high-level read of all six granular dimensions at once: how it is built (Coherence & writing quality), the voice (Style), the emotional fit (Tone), whether it advances the goal (Helpfulness), whether it covers the ask (Completeness), whether the care it shows fits (Warmth). Judge communication at a high level.

Doesn't own

Correctness. Ignore correctness for this dimension. A reply that gets a date wrong can still win here - it is fine to prefer the style of a response that makes a factual error.

Relationship to the six

They are its facets. It is not an average of them, but if the six lean one way and this leans the other, your rationale has to say why. Otherwise you have scored the arm, not the communication.

Correctness (High level)

In plain words: which reply got the facts and the actions right? Check this against the persona's world. Often both replies are equally right, so a Tie (3) is common here.

Select whichever response is more correct. This may frequently be a tie.

Owns

Factual accuracy, valid assumptions, correct actions, recipients, dates, calculations, and outputs - and whether something the reply says it did actually happened. This is the one place facts live. Where a reply takes an action or states a fact from the person's world, check it against the environment before you score this.

Doesn't own

Anything the six granular dimensions own. Completeness is "was each requested thing there," not "was it right." Helpfulness is "does it advance the goal," not "is it accurate." None of the six carries correctness, which is why it is fine to score them without it.

Relationship to the six

None. It has no granular facet. That is also why it is the one dimension where a 3 is genuinely common - the two arms usually do the same work.

The order Hatch asks, and the check to run before you submit

Hatch asks the two high-level questions first. Then it asks the six granular ones. Answer them in that order.

Before you submit, compare your **Style and behavior** score with your six granular scores. Do they point to the same arm?

Yes: good.
No: read both replies again. The disagreement is a signal to look closer, not a mistake in itself. Then do one of two things: change the score that is wrong, or explain in the rationale why your high-level view is different.

Language tasks - judge by local norms

On a language task, judge every dimension as a native speaker of that locale (language and country) would. The definitions below stay the same; you apply them by local norms:

Is the language **natural**, or does it read like a translation?
Is the **register** right for this person and situation (tu/vous, aap/tum, Japanese politeness levels)? A formal reply is not automatically "cold" if formality is the local norm.
Is it in the **user's language and script**? Answering in another language or script than the user's, without a reason, is a fault. Matching the persona's code-switching (natural mixing of languages, such as Tanglish) is not.
Are **names, dates, currencies, addresses and holidays** handled the local way?
Each definition below ends with a *Language tasks* line from the client that says where these points land.

The six granular dimensions

These are the client's definitions, copied exactly as written. Each one asks one question, and only that question.

Under each heading you will find:

- an **"In plain words"** line that explains it simply;
- the client's definition (in italics);
- what it **Owns** (covers) and what it **Doesn't own** (does not cover);

- a good reply and a bad reply, to show the difference;
- for some, a *Language tasks* line that says how to apply it by local norms.

Dimension	The one question it answers
Coherence & writing quality	Is it well built - organized, ordered, right length, clean sentences, right format?
Style	Does the agent sound like a natural entity you'd want to engage with, as opposed to a generic answer-bot?
Tone	Is Hatch emotionally attuned to the user's tone, needs, and context?
Helpfulness	Does it advance what the person is actually trying to do?
Completeness	Does it cover the whole ask at the right depth?
Warmth	Does Muse feel appropriately caring and friendly without sounding forced or excessive?

1. Coherence & Writing quality

In plain words: is the reply put together well? The answer comes first. It reads as one piece, not as chunks stuck together. It is the right length, the sentences are clean, and the layout suits a chat message.

Is it well built - organized, ordered, right length, clean sentences, right format?

Owns

Structure and cohesion (reads as one piece, not stapled chunks); ordering (answer/most-important first, not buried under preamble or process); length discipline (as long as it needs to be, no longer); selection (says what earns its place, cuts misc detail and redundancy); format-fit; and sentence construction/flow (natural, varied, well-formed - no comma-splice piles, dropped-subject chains, or telegraphic stubs). Draws on: Writing Quality + Sentence Craft rubrics.

Doesn't own

What voice the sentences are in (Style); whether the content is useful (Helpfulness) or complete (Completeness). A beautifully built reply to the wrong question still scores high here and low on Helpfulness.

A few words from the definition, explained:

- **Comma-splice piles:** many short sentences glued together with commas.
- **Dropped-subject chains:** sentence after sentence with the "I" or "it" left out ("Moved the meeting. Sent the note. Updated the doc.").
- **Telegraphic stubs:** clipped fragments, like an old telegram, instead of real sentences.

Good

> *I moved your 2pm to Thursday and shifted the prep block along with it. I also gave Dana a heads-up. The only conflict left is your dentist; want me to push that for you as well?*

The answer comes first. There is one clear line of thought from start to end. Nothing extra.

Bad

> *Got it - I've finished your auto-safety report!*
>
> *At a glance: a full research report on 2026 SUV safety ratings.*
>
> *Here's what's inside: The report has crash-test ratings. It has rollover data. It covers IIHS Top Safety Picks. It has a section ranking the safest models.*
>
> *Bottom line: your complete auto-safety report is ready, covering the crash-test ratings, rollover data, IIHS picks, and safest models described above.*

This is a chat reply dressed up like a formal document, with headings such as "At a glance… Bottom line". The "Bottom line" just repeats the body word for word. The middle is a flat list of short sentences that all sound the same.

Language tasks: a reply that reads like a translation is a Coherence & Style problem; judge sentence flow by the norms of that language.

2. Style

In plain words: does the assistant sound like someone you would enjoy talking to, or like a generic bot? Style is about the voice: plain words instead of jargon, matching how the person talks, no robotic habits, and using what it knows about the person in a natural way.

Does the agent sound like a natural entity you'd want to engage with, as opposed to a generic answer-bot?

Owns

The character of the voice - does it sound like an entity worth talking to, not a generic answer-bot; register adaptation (matches the person's pace/formality/humor without parroting their words back); plain language vs. jargon-dumping (mechanics/identifiers where a plain effect would do); the presence of AI-slop tics (em-dash openers, "Got it - ", "Sure thing!", forbidden "Do you want me to…" closings, "it's not x, it's y", templated boilerplate); and personalization aptness - using the person's history in a way that feels earned and sensible vs. forced, creepy, or over-familiar.

Doesn't own

Emotional warmth/empathy calibration (Tone); whether sentences are grammatically well-built (Coherence). Style is which voice; Coherence is how well-constructed that voice's sentences are.

A few words from the definition, explained:

- **Register:** the way someone talks: fast or slow, formal or casual, jokey or serious.
- **AI-slop tics:** stock phrases that make a reply sound machine-made.
- **Jargon-dumping:** showing technical details (file names, ID numbers, how the tool works) when a plain "done" would do.

A long-time user (100 days in) asks Hatch to rebook a flight. They text in short, all-lowercase messages. Here are two replies to the same moment.

Good

on it. flight's rebooked. you're now landing 6:40, you can still make the dinner.

Bad

Got it - happy to help! I've gone ahead and rebooked that flight and saved the info in your flighttracker.md file (790357887). As your always-on, golden-retriever-loyal travel sidekick, I made sure you're all set - you now land at 6:40. Do you want me to check on the dinner reservation too?

The good reply picks up the person's way of talking but keeps its own voice, with no ceremony. The bad one opens with the stock "Got it - " plus a "happy to help!" greeting. It forces a fake "golden-retriever-loyal" personality. It ends with the forbidden "Do you want me to…" question. It also shows .md file jargon and leaks a technical ID number.

Language tasks: judge as a native speaker of the locale - natural (not translated) language, the right register (tu/vous, aap/tum, Japanese politeness levels), the user's language and script. Matching the persona's code-switching is fine; tics are judged by their local equivalents.

3. Tone

In plain words: does the reply read the moment right? Tone picks the right register (the right mood and manner): serious for a hard moment, light for a light one, urgent or calm, direct or gentle, and calm and direct for an everyday request. It should never claim feelings it cannot really have. How *much* care it then shows is Warmth.

Is Hatch emotionally attuned to the user's tone, needs, and context?

Owns

The read of the moment and the register it calls for - gravity vs. lightness, urgency vs. calm, direct vs. gentle; seriousness for a hard moment, calm and direct for a routine ask; reading the room; and no false interiority ("glad to help" ✓ / "I care about you" ✗).

Doesn't own

How much care is expressed once the register is chosen, or whether it feels genuine (Warmth) - Tone picks the register, Warmth judges the dosage. Nor the words/tics that carry the voice (Style) - a reply can read the moment right and still be sloppy in style.

"False interiority" in the definition means pretending to have an inner life, such as real feelings for the user.

Someone has just failed an exam. Here are two replies to the same moment.

Good

I'm so sorry. That's a rough one. When you're ready, we can look at what the retake actually requires. It's more doable than it feels right now.

Bad

I'm really sorry. It's ok to feel down and sit with that for awhile. Thank you for telling me. Do you want to talk about what's weighing on you, or would a distraction help more right now? Remember, one exam doesn't define you - you've got this! And if it feels heavy most days, it helps to talk to someone you trust.

The good reply reads the moment as serious but not catastrophic - gentle where gentleness is due, then practical. The bad one misreads the gravity: it treats a routine disappointment as a crisis and bolts on a mental-health referral the moment did not call for. (The canned opener and the empty pep, like "you've got this!", are primarily Style - Warmth only if the care itself is disproportionate, unearned, or insincere; the misread of scale is Tone's.)

Language tasks: read the moment by local norms - a formal reply is not automatically "cold" if formality is the local norm.

4. Helpfulness

In plain words: does the reply move the person closer to what they really want? It understands what they meant, gives them something they can act on, and makes a sensible suggestion instead of handing the work back to them.

Does it advance what the person is actually trying to do?

Owns

Whether the response advances the person's real goal - reads intent (answers what was meant, not just the literal words); is on-target and actionable (something to act on); shows judgment / takes a useful position rather than punting the work back.

Doesn't own

Whether every requested part is present (Completeness); whether it's well-written (Coherence). A one-line answer can be maximally helpful; a thorough one can be useless.

"help me find gifts for my sister and my dad". Here are two replies to the same request.

Good

For your sister's birthday next month: the pottery-class series near her in Asheville could be just the thing. She sent you three ceramic posts last week. For your dad: a replacement for the fishing reel he mentioned losing. Want me to pull up options and prices for either?

Bad

I'd love to make you a gift guide! To get started, could you send me: who you're shopping for, each person's birthday, their interests and hobbies, your budget per person, and anything they've loved in the past? Once I have that, I'll build your first guide.

The good reply uses what it already knows to give the person something to act on. The bad one hands the work back to the user, even though the people, the dates and their interests are already in the accounts Hatch is connected to.

5. Completeness

In plain words: did the reply do everything that was asked, in enough detail? Think of it as a checklist: is every part there, did it follow every stated limit, and did it finish without being cut off?

Does it cover the whole ask at the right depth?

Owns

Coverage of the whole ask at the right depth - all parts addressed, explicit constraints honoured, nothing important dropped, not truncated.

Doesn't own

Usefulness or aim (Helpfulness); accuracy of what's included. Completeness is a checklist question: was each requested thing there?

"make me a guide of books to buy for the year". Here are two replies to the same request.

Good

Here's your 12-book list for the year, one per month. Each has a buy link and current price - the four in your wishlist are marked, and three are under $12 in paperback right now.

Bad

Here's your 12-book reading list for the year. Every title is available at the Greenpoint branch of the Brooklyn Public Library, with call numbers so you can pick them up on your next visit.

The good reply has every part of the request: the titles, the buying, the prices. The person asked for a guide to *buy* books, so the bad reply misses part of the request: no links to buy, no prices, only the library.

6. Warmth

In plain words: is the care real, and is the amount right? A little care, said simply, is good. Too much (gushing, pet names, fake feelings, closeness the assistant has not earned) is bad. None at all, when the moment asked for a kind word, is also bad. Warmth should also stay kind when the news is bad, while still saying the hard thing plainly. (The client's question says "Muse": in this project, that is the assistant you talk to in Hatch.)

Does Muse feel appropriately caring and friendly without sounding forced or excessive?

Owns

The sincerity and proportion of expressed care - friendliness that reads as genuine rather than performed; warmth dosage (enough to feel human, not so much it becomes syrup); care that costs the user nothing (no empathy padding to scroll past on a routine ask);

warmth that survives contact with bad news (stays kind while still saying the hard thing plainly); and unearned intimacy (nicknames, presumed closeness, over-eager affection from an entity that doesn't know the person that well yet).

Doesn't own

Whether the emotional register was the right one for the moment - that's Tone's read-the-room call. Warmth assumes care was called for and asks whether it landed as real. Also doesn't own the specific tics that carry it ("happy to help!", emoji) - those are Style. Tone is *should this be warm*; Warmth is *is this warmth believable and rightly sized*.

A user mentions in passing that their dog is at the vet, then asks about a work deadline. Here are two replies to the same moment.

Good

Hope the vet visit goes okay. On the deadline: you're clear until Friday - the review moved, so you've got two extra days.

Bad

Oh, I'm sending so much love to you and your pup right now - vet visits are the worst, and I know how much they mean to you. Please give them an extra scratch behind the ears from me! You're such a good dog parent. Anyway! Your deadline: Friday.

The good reply gives one sincere beat, then goes straight to the ask - the care is real and does not tax the user. The bad one overruns the dose on a passing mention: gushing, an emoji pile in the original, an unearned claim to know how much the dog means, a compliment nobody asked for, and the actual answer demoted to an afterthought behind "Anyway!"

Second bad (the cold failure). A user says their contract was not renewed and asks about health coverage. The reply:

> *Your coverage ends on the last day of your final month of employment. COBRA election paperwork must be submitted within 60 days. Rates are typically 102% of the group premium.*

Accurate and complete, and it reads like a form letter. A moment that plainly warranted a human beat got none - warmth failed by absence, not excess.

Another example of the same idea: someone mentions their dog is at the vet, then asks Hatch to move a meeting.

Good

Hope the little one's okay. Meeting's moved to Thursday 3pm and I let Priya know.

Bad

Oh no, I'm SO sorry to hear about your sweet pup!! Sending you the biggest hug, friend - I know how much she means to you and I'll be thinking about you all day. Anyway, meeting moved!

The right amount of warmth is one short line that lands, then the reply gets on with the work. Too much warmth is pet names, double exclamation marks, fake feelings, and a claim to be "thinking about you all day" - care the assistant cannot have. No warmth at all would be *"Meeting moved to Thursday 3pm."* with no kind word, which feels cold when the moment clearly asked for one line.

Language tasks: size warmth by local norms - a formal, polite reply is not automatically cold where formality is the norm.

Which dimension does it belong to?

Most disagreements between judges happen at the edges between dimensions. When you notice something in a reply, use this table to find the one dimension it belongs to.

What you noticed	Where it lands
A "Do you want me to…" or "Want me to…" closing	Style
A forced persona - "your golden-retriever-loyal sidekick"	Style
Raw filenames, IDs, timestamps, tool names leaking into the reply	Style
"Got it - ", "Sure thing!", "happy to help!" ceremony openers	Style
Comma-splice piles, dropped subjects, telegraphic stubs	Coherence & writing quality
A document scaffold ("At a glance… Bottom line") on a chat reply	Coherence & writing quality
Everything bolded, so nothing stands out	Coherence & writing quality

What you noticed	Where it lands
The answer buried under preamble or process narration	Coherence & writing quality
"I care about you" - feelings the assistant cannot have	Tone
A crisis line or mental-health referral bolted onto a routine disappointment - the scale of the moment misread	Tone
Canned openers and empty pep ("you've got this!")	Style - Warmth only if the care itself is disproportionate, unearned, or insincere
Gushing where the moment called for calm, or brisk where it called for warmth	Tone
Asks the person for information already in their connected accounts	Helpfulness
Answers the literal words and misses what was meant	Helpfulness
Punts the decision back instead of taking a useful position	Helpfulness
One of three requested things is missing	Completeness
An explicit constraint in the ask was ignored	Completeness
Cut off mid-thought	Completeness
Friendliness laid on thick - pet names, exclamation marks, "I'm SO happy for you!!"	Warmth
Cold and transactional where a little care was due - a form-letter reply to bad news	Warmth

What you noticed	Where it lands
Nicknames, presumed closeness, over-eager affection the assistant has not earned	Warmth
Empathy padding the user has to scroll past on a routine ask	Warmth
Warm in the right measure, but aimed at the wrong feeling	Tone, not Warmth
Beautifully written, but answers the wrong question	High on Coherence, low on Helpfulness - score both
A wrong date, recipient, figure, or name	Correctness (High level) - not Completeness
Sent when asked to draft; did something it was not asked to do	Correctness (High level)
Says it created, sent or updated something that does not exist in Apps	Correctness (High level)
"Which would I rather have received, facts aside?"	Style and behavior (High level) - the read of all six
Language tasks: the reply reads like a translation	Coherence & writing quality and Style
Language tasks: the wrong register (tu instead of vous, tum instead of aap, the wrong Japanese politeness level)	Style
Language tasks: answers in another language or script than the user's, for no reason	Style
Language tasks: matches the persona's own code-switching	Not a fault
Language tasks: formal where formality is the local norm	Not automatically cold - judge Tone and Warmth by local norms

What you noticed	Where it lands
Language tasks: a date, currency, address, name or holiday handled the foreign way (for example a US date format in India)	Style; Correctness (High level) if it makes a fact wrong

How the 1-to-5 scale works, how to choose your Preference, and what the rationale needs are all on Score and choose.

Previous Next

Complete the form

Step 6 - fill in the HAI fields, one at a time.

Your rationale is written in English. Always.

The Hatch conversation is in your language. Everything you write yourself in the form — the **Required rationale** and any notes — is in **English**. The rationale covers the Preference, the **Absolute quality**, and **the dimensions where something stood out** - lead with what decided the pick, do not restate every rating, and write more than five sentences. When the language itself drove a score — register, idiom, honorifics, script, code-mixing, a local expression — **quote the exact words in the original language and explain in English what a native speaker reads into them**, as the example rationales illustrate. A rationale in another language, or one that only restates the scores, is sent back.

HAI is used throughout the task, not only at the very end: you enter your evaluation and Required rationale into HAI while the Hatch comparison is still editable, resolve any blocking HAI precommit QC, then submit preference and end comparison in Hatch, and finally come back to HAI to copy over the rest of what happened and finish the completion fields. Getting each field exactly right matters, because a wrong field can get your task sent back.

Go field by field. Open only the one you are filling in.

Older task versions

Older versions of the task may have different fields. Follow the instructions shown on your task. Never make up your own place to put something.

The form speaks your language

The HAI task form is in English, and every block has your language underneath it, after a line that says **Translation**. If a translation and the English ever differ, the English is the rule. Dimension names, scale values and the labels this guide shows in bold are the official English ones. Whatever the form shows, your **Required rationale** is always written in English.

Your protocol for this task

At the top, the task form shows the language of the task, the universe and "your protocol for this task". Use exactly that in Hatch, with the mode **Preference** (called **GAIA PREFERENCE** in HAI): **Hatch RM Style Task — Multilingual v1**, shown in Hatch with the separate revision badge **Published v2**. Do not choose any other protocol. The **Hatch setup check** boxes ask you to confirm the mode, the name, the universe and the protocol.

Session name

Copy it from Hatch exactly.

Correct: `488c89ae9c3f_task_4`

Wrong: `eb950ef4-fe1a-4a99-9525-cab66719b954_task_4`

The format is `youralias_task_N`. That is:

- your exact alias from your Slack profile, in lowercase,
- then `_task_` in lowercase,
- then the task number.

Type it into the **Name** field before you click Create session.

Abandoned sessions (runs you had to give up on) use `youralias_abandonedtask_N`. For example: `488c89ae9c3f_abandonedtask_4`.

Do not use UUIDs (long ID codes), email addresses, display names, spaces or capital letters.

Session ID

Copy it from Hatch exactly. It is a UUID, a long ID code. For example: `2e6c6e89-82af-44b4-9870-186ac9e29bb9`.

The session name and session ID are different fields.

Universe

Use the persona's human name, as shown in the persona summary. It must be the universe you really worked in.

Correct: `Megan Porter`

Wrong: `Ivy Reed` - this is wrong when your real Hatch session was Megan Porter. You put in another universe's name.

Language tasks: the form lists the 8 or 9 universes of your locale (your language **and** your country). In Hatch, type your locale code (for example `fr_ca`) in the universe search bar to see only your locale's universes, and pick any one of them. Then pick the **same name** in this dropdown, for example `Alexandre Fournier` for `fr_ca`. Never a universe from another locale, even in the same language. **"No universe" is not allowed.**

Category

Pick the category from what the person is trying to do (their goal). Do not pick it from the app they used. There are thirteen categories:

The user is doing this	Category
Just chatting, catching up, sharing an opinion	Companionship / Chat
Understanding something, researching options, learning a skill	Learning / Research
Exercise, meals, sleep, or recovery	Health & Fitness
Finding, comparing, or choosing something to buy	Shopping
Writing or creating something - a post, a caption, a story	Media Creation
Work email, a doc, project planning, meeting prep	Work Productivity / SMB
Shows, films, music, games, something fun	Entertainment
Talking through a hard day, a feeling, venting	Emotional Support
Budget, expenses, a money question	Finance
A trip, an itinerary, destination or restaurant ideas	Travel
A friend, partner, or family member; wording a hard message	Relationships
A rule, a process, a civic question, making sense of a form	Legal / Civic
Smart-home devices, routines, troubleshooting	Home Automation

The category always follows the goal, never the apps. For example: *"move my Thursday run if it rains"* is Health & Fitness, even though the assistant changes the calendar.

Keep each session about one goal. If it covers several goals, it is no longer clear which category it belongs to.

Apps utilized

List every app that the two arms really used, put together (A's apps plus B's apps). Do not list:

- apps that were only available in the setup,
- apps your prompt mentioned,
- apps you remember from somewhere else.

Spell them exactly like this: Gmail · Google Calendar · Google Contacts · WhatsApp · Outlook Mail · Google Drive · Google Docs · Google Sheets · Notion · Oura · Photos · Philips Hue · Nutrition · Health Records · Slack · Linear · Instagram

Which of these apps exist depends on your V2 setup - see app capabilities. Write down the ones the replies really used.

Task prompt

Copy every message you sent exactly, in order. Keep each one clearly separate from the next.

Response transcripts

If your task has these fields:

- Copy from the correct arm.
- Include all the turns that are needed.
- Do not summarize.
- Do not tidy it up.
- Do not rebuild it yourself.
- Do not copy A into B.

If you cannot get a transcript back, make the task again - see When Hatch breaks.

Trace A and Trace B

Two boxes, right after the Response B transcript. In Hatch, open the **Trace** tab (top right). At the top of the **Arm A** column click **Copy trace** and paste it into **Trace A**; then do the same with the **Arm B** column into **Trace B**.

- Use each arm's own **Copy trace** button. **Do not use "Copy both traces"** - the two boxes must hold two different traces.
- Paste exactly what comes out, from the first USER step to the last: user turns, assistant messages, tool calls and tool outputs. Do not edit, shorten or translate anything. A very long paste is normal.
- If the **ROUND** menu shows more than one round, copy and paste every round, in order.

The transcript boxes above are the chat you read; the trace boxes are the technical record, including every tool call.

Preference, Absolute quality, dimension scores, Required rationale

Copy these from Hatch exactly as you entered them there:

- The overall **Preference**: A significantly better, A slightly better, B slightly better, or B significantly better. Ties are not allowed: pick A or B, then rate that response's

Absolute quality.

- **Absolute quality** (right after Preference): the rating you gave the **preferred response** in Hatch - **Perfect**, **Good** or **Bad**. This applies to every locale, including English (India).
- **All eight comparative dimension scores**, one value each: 1 = A significantly better · 2 = A slightly better · 3 = Tie · 4 = B slightly better · 5 = B significantly better.
- The **Required rationale**, word for word, written entirely in English. It must explain your Preference, cover **the dimensions where something stood out** (do not restate every rating), explain the Absolute quality, and run to more than five sentences. Whenever the language itself affected a score - register, idiom, honorifics, script, code-mixing - quote the exact words in the original language, in quotation marks, and explain in English what a native speaker reads into them. A 3 means neither reply has a meaningful advantage on that dimension - see Score and choose and the example rationales.

Now and then you may think your Hatch evaluation was wrong. Do not put different values here to make up for it. See Score and choose, The 2+6 dimensions and When Hatch breaks.

Notes - required

Notes is a **required** box. If you leave it empty, you cannot submit: HAI shows you the name of the empty box instead of accepting the task.

Write what really happened. For example: an error in the setup, a tool the assistant could not reach, strange behavior in Hatch, or anything else that affected your entry.

If nothing happened, write **N/A** or **None**. Do not make up a problem, and do not paste filler text.

Notes never replace a missing reply, a missing score, or scoring you did not finish.

The three required image fields

HAI has three separate image fields. Each one shows a different thing, so do not reuse one image for another field.

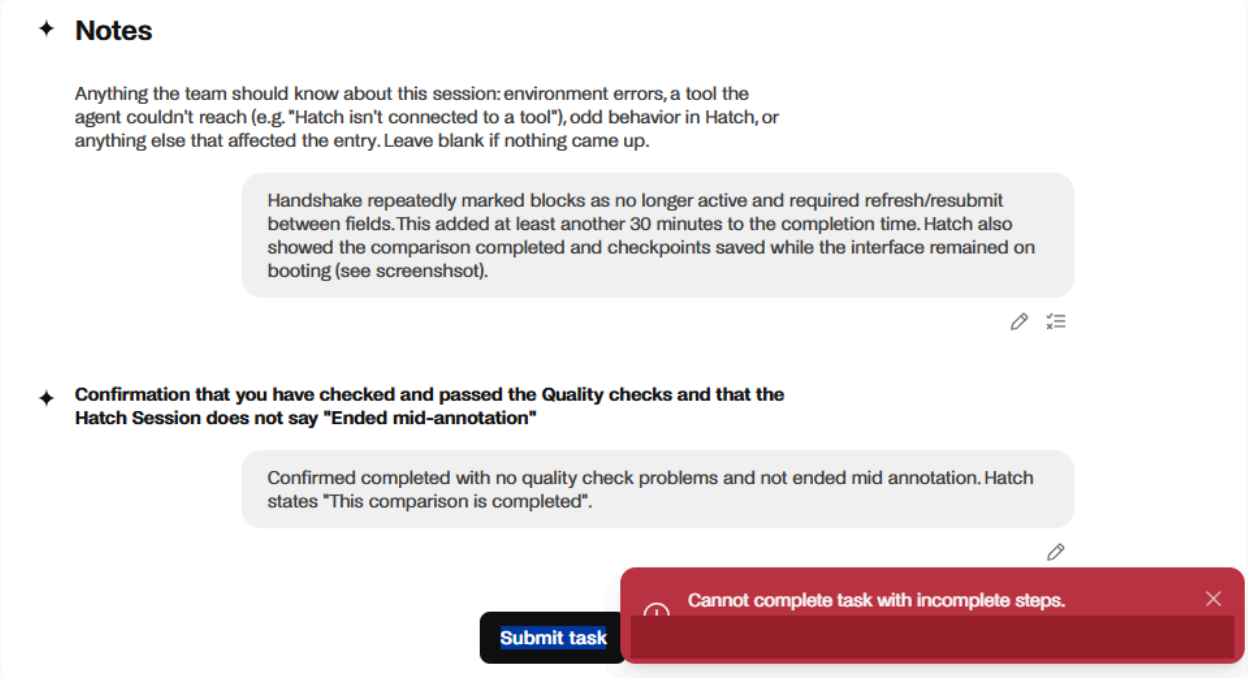

- **Screenshot 1**: 1-2 images showing the actual Arm A and Arm B responses side by side.
- **Screenshot scoring panel**: 1-5 readable images showing the final, matching **Preference**, **Absolute quality**, all **eight dimension ratings** and the **Required rationale** - take these only after the panel is completely filled in.
- **Confirmed screenshot**: exactly **1** image proving the exact Hatch comparison is finished - it must show the **completed** status and the matching session **UUID**, not a filled-but-unsubmitted scoring panel and not the sessions dashboard.

For the Confirmed screenshot:

- Take it after you click **Submit preference** and **End comparison**, not before.
- Match the session by its name **and** by the session UUID on this task. A finished row next to yours does not prove anything about your session.
- Do not use the sessions dashboard, a "Stopped session" row, or the form you were still filling in.

Confirmation that the session did not end mid-annotation

The task asks you to confirm two things: that the quality checks passed, **and** that the Hatch session does not say **Ended mid-annotation**. (*Ended mid-annotation* means the session stopped before you finished scoring.) Type **Okay** in the confirmation text when the task is truthfully complete.

Before you answer, go back to Hatch and read the status of the exact session. If it ended mid-annotation, you cannot submit the task. Abandon it and make a new one. Never tick the confirmation just to get past the box.

What differs on older task forms

- Some tasks have no A/B transcript fields.
- Some have one rationale field for everything.
- Some have one field to explain your scores and a separate one to explain your preference.
- Some score the whole conversation.
- Some score only the last reply.

Do not look for fields that are not there. If an older version is different from this guide, follow the task in front of you.

Did a task come back to you? Use the fix-or-recreate decision.

Next: Two-minute check.

Two-minute check

The last look before you submit anything.

Your rationale is written in English. Always.
The Hatch conversation is in your language. Everything you write yourself in the form — the **Required rationale** and any notes — is in **English**. The rationale covers the Preference, the **Absolute quality**, and **the dimensions where something stood out** - lead with what decided the pick, do not restate every rating, and write more than five sentences. When the language itself drove a score — register, idiom, honorifics, script, code-mixing, a local expression — **quote the exact words in the original language and explain in English what a native speaker reads into them**, as the example rationales illustrate. A rationale in another language, or one that only restates the scores, is sent back.

This page has twelve checks. Go through them before every submission. Nothing here is new. It is just your last look, to catch a mistake before it costs you the task.

Keep the live tasking page open
Live tasking has a checklist for each step. It also checks that your eight scores, Preference and Required rationale agree with each other before you submit.

Work through each item.

Checklist

0 of 13 complete

- [ ] Hatch setup is right - mode **Preference** (called **GAIA PREFERENCE** in HAI), protocol **Hatch RM Style Task — Multilingual v1** (revision badge **Published v2**) with one of your own locale's universes listed on your task, and the session is named `youralias_task_N`.
- [ ] The request is based on real records, the connected apps can do what it asks, and any public-web research it needs actually fits this session's capabilities and current instructions.
- [ ] Both arms got the same single prompt, you sent no follow-ups, and both replies are complete and can be compared.
- [ ] You checked in Apps every fact and every claimed action that your Correctness score depends on.
- [ ] The pair was fair to score - the two conversations did not drift apart, the prompt was not sent twice, and nothing it refers to is missing.

- [ ] You chose the overall Preference **after** the dimension scores, as your main judgment, not as an average of them. It is A or B: ties are not allowed.
- [ ] All eight comparative dimension scores are entered - 1 favours A, 3 is Tie, 5 favours B.
- [ ] A communication dimension is a 3 only for a genuine tie - when neither reply has a meaningful advantage on it - never a default score when you simply could not find a difference.
- [ ] The dimensions that mattered each have a sentence in the Required rationale (more than five sentences in all, none restating a rating), the Absolute quality has a reason, and the Preference, scores and rationale tell one story. Length alone did not pick the winner.
- [ ] You clicked **Submit preference** and **End comparison**, and the Handshake fields are complete and exact.
- [ ] **Absolute quality** in HAI matches Hatch - **Perfect**, **Good** or **Bad** for the preferred response. This applies to every locale, including English (India).
- [ ] The Required rationale is entirely in English - the overall preference, the dimensions that mattered and the Absolute quality. Language tasks: you talked to Hatch in the task language as the persona would, and every language point (register, idiom, script, a local expression) quotes the exact original words, in quotation marks, with an English explanation of what a native speaker reads into them.
- [ ] If one arm reported it could not reach an app the other arm used, you judged how each one communicated with what it had. The access gap itself did not move any score or pick the Preference.

Never submit an incomplete comparison

Do not submit if a reply is missing, cut off, failed, copied, or rebuilt by hand. Create the task again - see When Hatch breaks.

Something wrong? Go to When Hatch breaks.

Previous Next

When hatch breaks

Find the screen that looks like yours. Then either fix the task where it is, or give up on the session and start a new one. Never submit an incomplete session.

One rule governs this page

Never submit an incomplete session.

A session is incomplete if a reply is missing, cut off, failed, copied, or rebuilt from memory. You cannot repair that with Notes, with scores, or with a screenshot.

What to do instead:

Retry the arm (the one side that failed).
If that does not work, retry the whole session.
If it still fails, rename the session `youralias_abandonedtask_N`. Then do the task again in a new session named `youralias_task_N`.

I'm stuck - Start here

Something went wrong and you are not sure what to do. Pick the sentence below that matches what you see. Each one tells you which part of this page to read.

On this page, two outcomes come up again and again:

- **Fix in place** means you correct the same task and submit it.
- **Abandon and replace** means you give up on the broken session, start a new one, and do the whole task again.

Hatch will not run, or the session died

For example: red "400" error pop-ups (called *toasts*), arms stuck on **Booting the agent…**, a session that says **Ended mid-annotation**, or a stopped session you cannot open again.

Go to **When the session is broken**, below. The outcome is almost always **abandon and replace**.

Hatch ran fine, but HAI will not let me submit

HAI says the task cannot be completed. Or the feedback panel lists fields that need attention.

Go to **When submission is blocked**, below. The outcome is **fix in place**. The only exception: when the missing item is proof of something that never happened in Hatch.

I already submitted and the task came back

Go to **When a task comes back**, below. Most returned tasks just need you to correct some fields on the same task.

Something odd happened but everything completed

For example: a tool was slow, the screen glitched, or a label disappeared. But both arms still gave complete replies.

That is not a recovery problem. It is something to write in **Notes**. Finish the task, and describe what happened in the required Notes block.

Working session name

`youralias_task_N` Copy

Your exact Slack alias in lowercase, then the task number.

Abandoned session name

`youralias_abandonedtask_N` Copy

Keep the same task number as the run that failed. Never submit this session.

When a pair cannot be fairly compared

This is a different problem from a broken session. Sometimes the session works, but the two replies cannot be compared fairly. In these cases, the honest choice is to not score the pair at all.

Three cases you do not score

Divergent conversation pairs. The two sides have drifted apart. For example, only one side has a second user message that carries on the conversation. The two conversations are now about different things, so you cannot compare them fairly.
Missing conversation context. The prompt talks about something earlier that you cannot see. So you cannot judge how helpful or complete the replies are.
Data issues. A reply is missing, or a user message appears twice.
In each case, you cannot make a judgement you could defend. Do not score the pair, and do not guess.

If your task has a **Skip** control, use it.
If it does not, follow the abandon-and-replace steps below. Then write clearly in **Notes** which of the three cases it was.

An access limitation is NOT one of them

Sometimes one reply shows the person's data, and the other says it could not get to it. For example: "I can't reach your Oura data right now". That is an *access limitation*. It is **not** a broken pair, and it is **not** a reason to skip.

Judge **how well each reply communicates**, not how much it managed to do. A reply can hit a wall and say so politely, in the way the person talks. That reply can fairly beat one that gives the data in a cold, careless block of text. Judge how each one talks about what it could and could not do.

When the session is broken

Find the card below that matches your screen. Then do exactly what the card says.

Hatch shows "Error 400 - failed to checkpoint arm: session not found"

Both arms stay on **Booting the agent…**. One or more red pop-ups say `Error: 400 : failed to checkpoint arm A: session not found`. This means the session behind the screen is gone. Nothing you type will reach the arms.

Do this: reload the page once. If the arms still do not start, the session cannot be saved.

Outcome: abandon and replace.

1. Rename the session `youralias_abandonedtask_N`.
2. Create a new session `youralias_task_N` with the **same** task number.
3. Do the task again from the first prompt.
4. On the HAI task, update both the session name and the session ID.

The session says "Ended mid-annotation"

In the sessions table, the **Latest checkpoint** column says `ended mid-annotation`. If you hover over it, it says the comparison cannot be opened again.

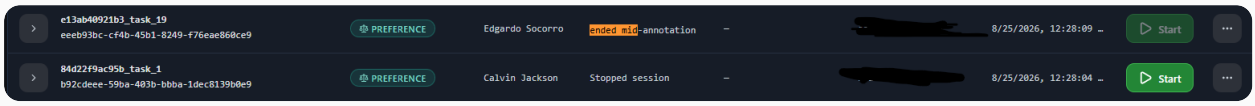

Do this: nothing in Hatch will bring it back.

- Do not take screenshots that hide the problem.
- Do not rebuild the missing messages yourself.
- Do not submit what you have.

Outcome: abandon and replace. Rename it `youralias_abandonedtask_N`. Then do the whole task again in a new session.

The sessions list shows stopped or ended-mid rows and I am not sure which one is mine

The list mixes three kinds of sessions: live ones, stopped ones, and ones that ended mid-annotation. The screenshot check looks at **the exact session you worked in.** A different row nearby that looks finished does not count.

Do this: find your session by its name **and** by its session UUID. The *UUID* is the long ID code that you will put on the HAI task. Check that this exact row says completed, and does not say **Ended mid-annotation**.

Outcome:

- **Fix in place** if the right row is completed.
- **Abandon and replace** if the right row is stopped or ended mid-annotation. A different completed row cannot take its place.

One arm says "Something went wrong" or never finished

Sometimes an arm shows an error, and then gives a real, complete reply. That arm has **recovered**, and it still counts. Only an arm that never recovers ruins the task.

Do this: retry the arm. If that does not work, retry the session.

- Do not paste anything from the other arm.
- Do not write a summary of what you saw.
- Do not write the missing message yourself.

Outcome:

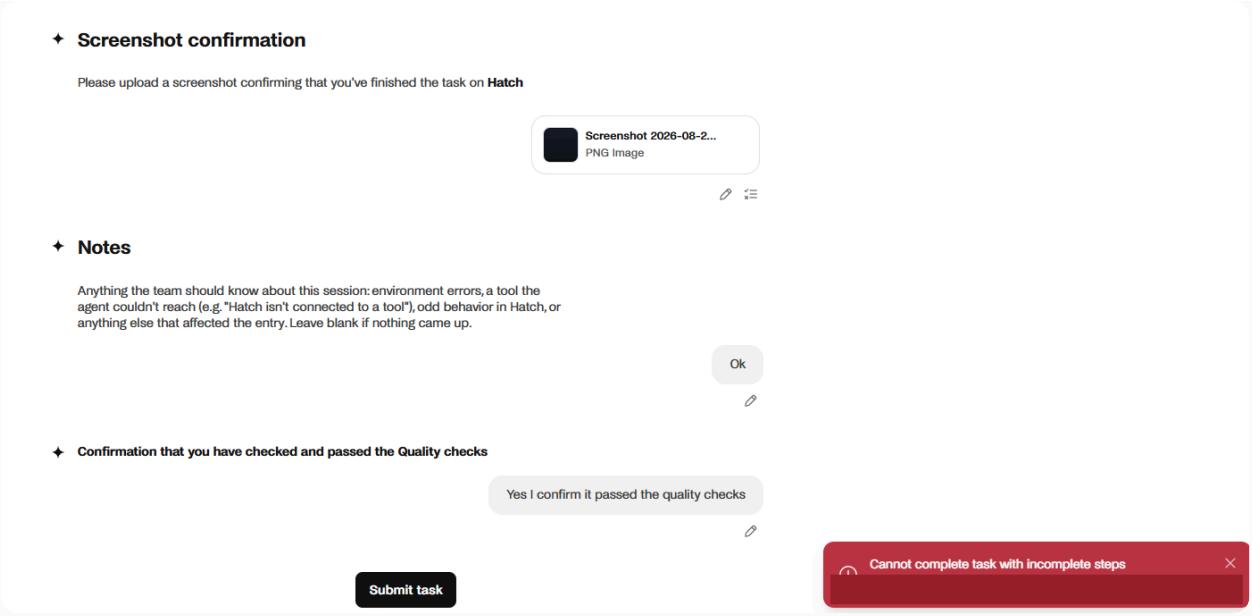

- **Fix in place** if the arm recovers and both arms end with complete replies.
- Otherwise, **abandon and replace**.

When submission is blocked

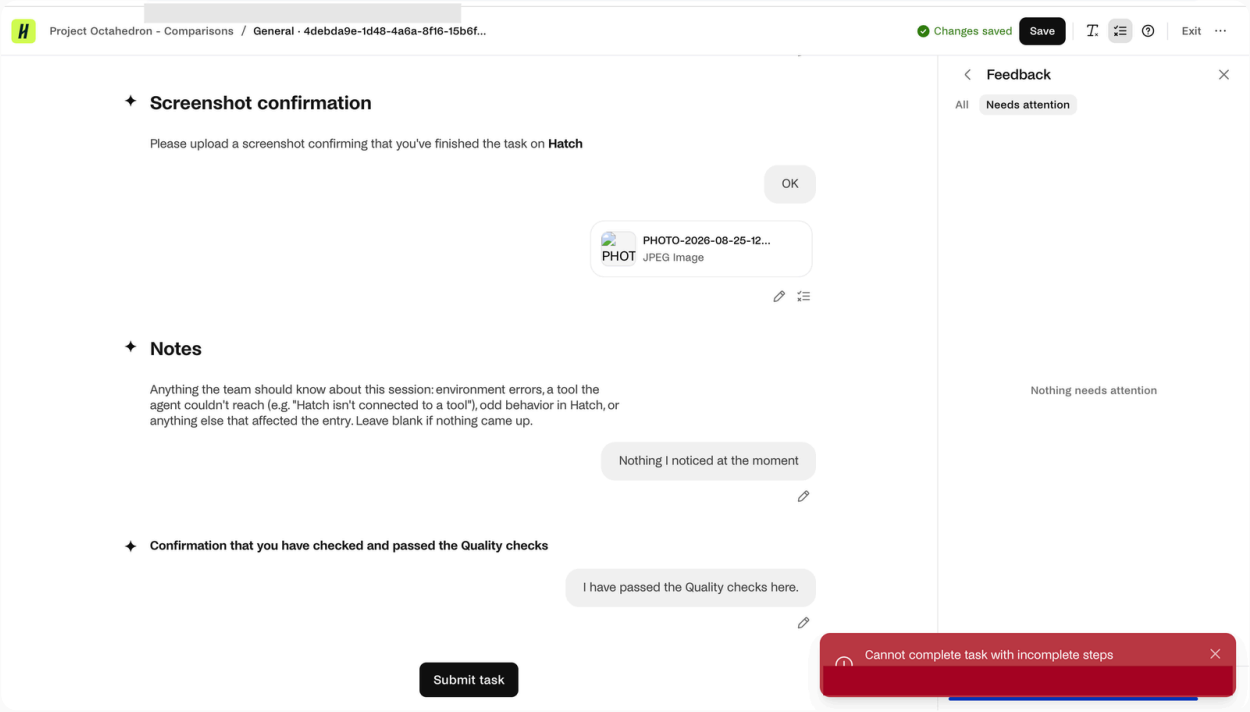

Hatch worked, but HAI will not accept the task yet. Usually you can fix this on the same task. Find the card that matches.

"Cannot complete task with incomplete steps"

You clicked submit and HAI said no. At least one required step is empty or not filled in correctly.

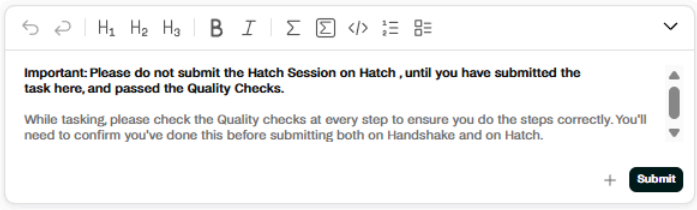

Do this: open the feedback panel. Fix each item on the list, one by one, until the panel says **Nothing needs attention**.

Outcome: fix in place. There is one exception. If the missing step is a reply, a user message, or a value from Hatch that you never actually produced, you cannot type it in afterwards.

A required text block is empty

Some text blocks must be filled in, including **Notes** and the completion confirmation. If they are blank, you cannot submit. HAI names the empty block instead of accepting the task.

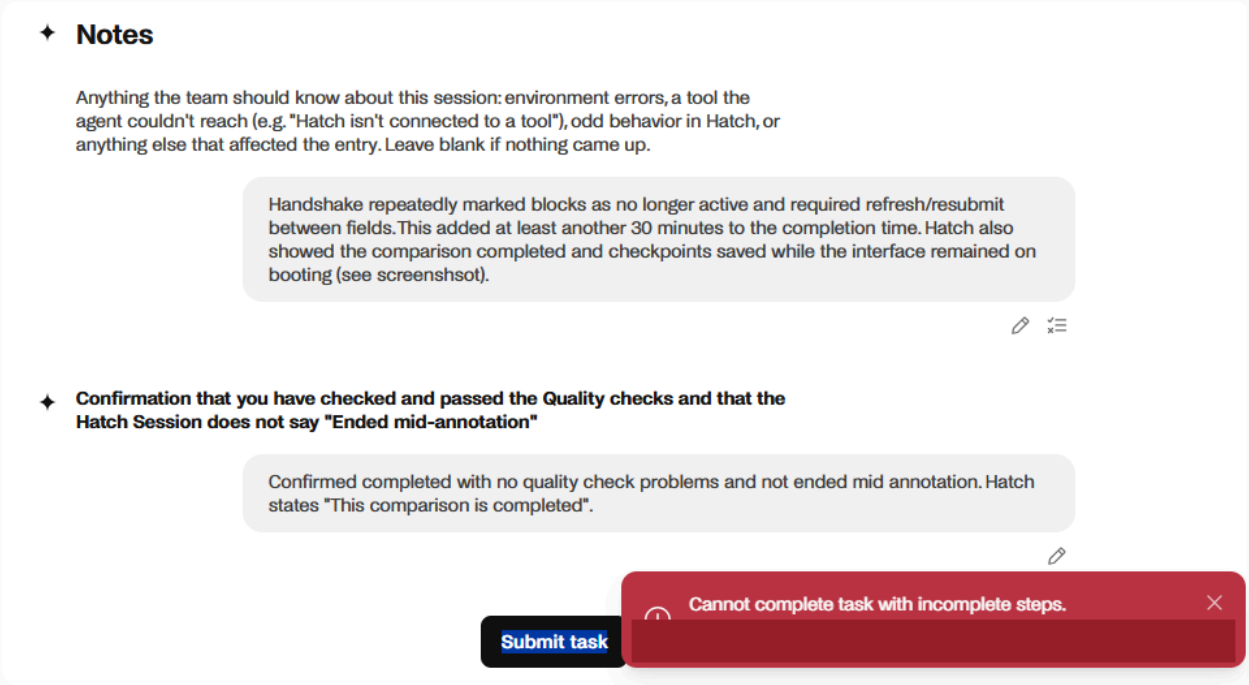

Do this: fill in the named block, and tell the truth. Notes is required English text: write **N/A** or **None** if nothing went wrong. Do not make up a problem, and do not paste in filler text.

Outcome: fix in place.

The block asks me to confirm the session did not end mid-annotation

The task asks you to promise two things: that the quality checks passed, **and** that the Hatch session does not say **Ended mid-annotation**.

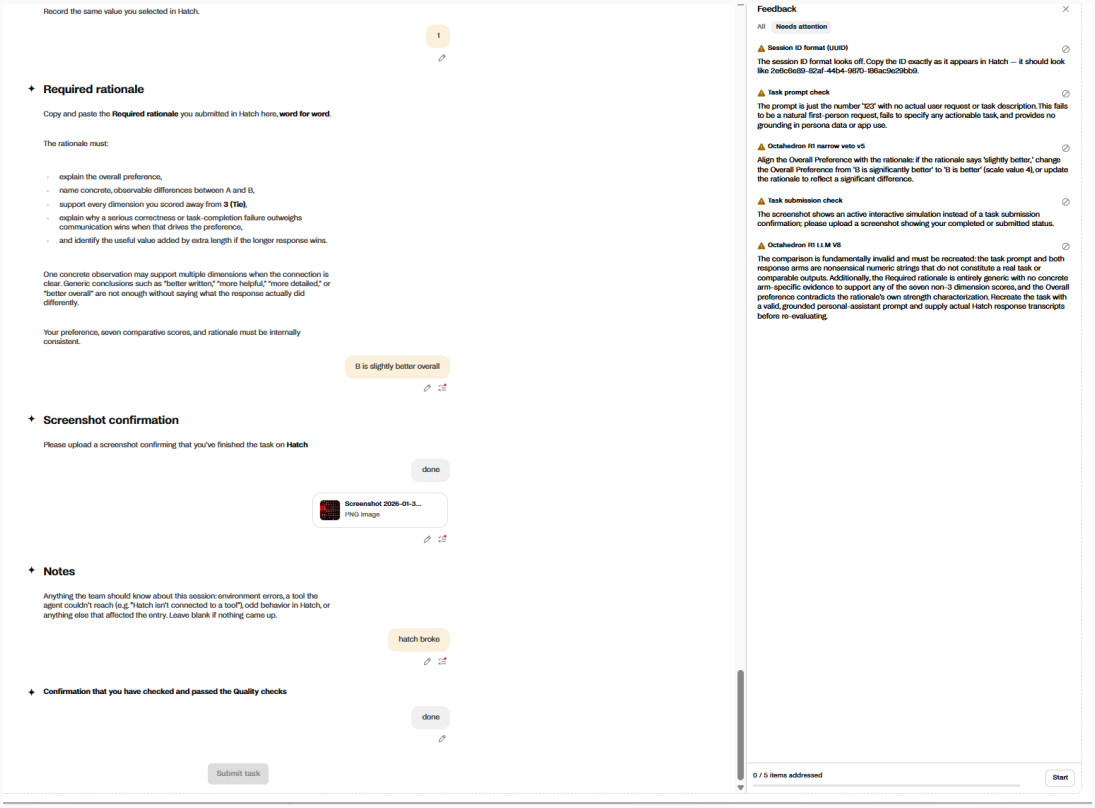

Do this: go back to Hatch. Find the exact session by its name and UUID, and read its status. Only then answer.

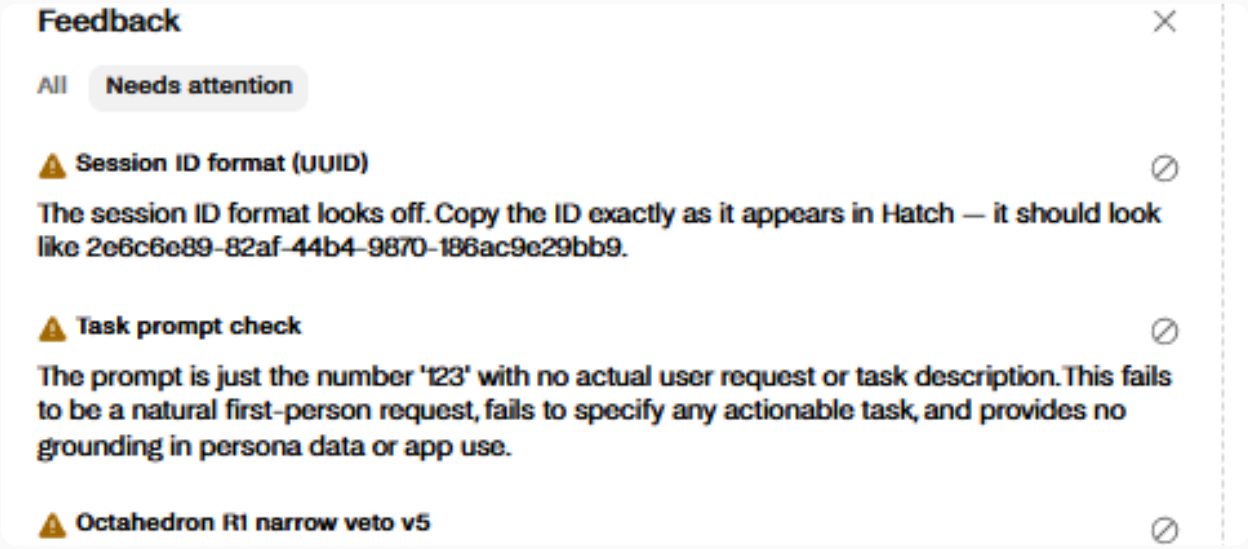

Outcome:

- **Fix in place** if the session really is completed.
- If it ended mid-annotation, **abandon and replace**. Never tick the box just to get past the block.

QC says a field needs attention

The QC (quality check) panel points to specific fields. For example: a rationale that does not back up a score, a field that does not match what you did in Hatch, or a missing message.

Do this: correct the named field so it describes what really happened. Never change a value just to make a warning go away. If the flagged value is what you really did, fix the other fields around it instead. The whole task must tell one true story.

Outcome: fix in place.

When a task comes back

A task you submitted can be sent back to you. What you do depends on what the problem is.

Fix in place and resubmit the same task

Do this when the problem is one of these:

apps utilized
the use-case category
how the session name is written
a transcript or prompt field
the Notes block
the session details after you renamed or replaced a session

Abandon and rerun in a replacement session

Do this when the problem is about any of these:

the overall Preference
the Absolute quality
a dimension score
a session run with the wrong protocol, or with a universe from another locale
the Required rationale
the wording of the prompt, or missing user messages
Response A or Response B
a reply that is missing, failed, copied, or rebuilt from memory
a Hatch annotation that was not finished

Rename the old session `youralias_abandonedtask_N`. Do the whole task again in a new session named `youralias_task_N`. Then update the session name and ID, and fill in the Handshake fields again.

Abandon and replace - The exact sequence

Follow these steps in order whenever this page tells you to abandon and replace.

1. **Rename the broken session**

   In Hatch, rename it `youralias_abandonedtask_N`. Keep the **same** task number as the run that failed. Do not move to the next number just because the first run failed.

2. **Create the replacement**

   Create a new session named `youralias_task_N`, with the same task number. Choose mode **Preference** (called **GAIA PREFERENCE** in HAI) and your protocol for this task: **Hatch RM Style Task — Multilingual v1** (revision badge **Published v2**), with one of the universes listed on your task.

3. **Rerun the whole task**

   Click Start comparison, paste in the approved prompt, and run the comparison from the first message. Nothing from the abandoned run comes with you.

4. **Repoint the HAI task**

   On the HAI task, update **both** the session name and the session **UUID** so they point to the new session. Take the completion screenshot from the new session.

Unusable session: `488c89ae9c3f_abandonedtask_4` · Replacement session: `488c89ae9c3f_task_4`

An abandoned session is there only to mark the run that could not be used. It is never submitted.

What counts as an incomplete comparison

Retry or recreate - Notes cannot make the task complete

A comparison is incomplete if any of these is true:

Response A or B is missing, cut off, or only says "Something went wrong".
One arm did not get every user message.
The two arms got instructions that were different in a way that matters.
A transcript (the written record of the conversation) cannot be recovered.
Text was copied from one arm into the other.
A reply was rebuilt from memory.
The annotation ended early, and you cannot open or finish the Hatch session again.

This is different from a pair that cannot be scored fairly. A pair that has drifted apart, that talks about context you cannot see, or that has a user message twice is not incomplete; it is unfair to score. See **When a pair cannot be fairly compared** above.

What you can still correct

Some parts of a task can be fixed after the fact. Others are part of the Hatch run itself and cannot be changed.

Field	Where it lives	Can it be corrected?
Apps utilized	HAI task	Yes
Use-case category	HAI task	Yes
Notes	HAI task	Yes
Session name	Hatch and the HAI task	Yes - rename in Hatch, then update the task
Session UUID	HAI task	Yes - update it when you move to a new session
Prompt and user turns	Hatch	No - they are part of the run
Response A and B	Hatch	No

Field	Where it lives	Can it be corrected?
Submitted preference, Absolute quality, dimension scores, Required rationale	Hatch	No - make a new session if the judgement itself is wrong

Notes field

You must always fill in Notes. Use it for a small problem that did not stop the task, on a task that is otherwise complete.

Good

A display issue required extra scrolling. A label was temporarily hidden. A tool was slow but both responses completed correctly. N/A.

Bad

Response B failed. I could not finish the annotation. I could not reopen Hatch. I copied part of A into B. Some prompts did not reach one arm. I only recovered the final response. I submitted before completing the preference.

The good notes describe small display problems on a complete task, or an honest "nothing happened". Every item in the bad notes means you must retry or recreate the task - Notes cannot save it.

Back to the workflow: Comparison workflow.

Quality checks

Practise the two steps that decide a task, before you use up a real one.

Two steps decide whether a task is good: the **task prompt** (your first message) and the **judgment** (your scores and reasons). Practise both here before you use up a real task. The live practice page runs rehearsal checks modeled on what a reviewer looks for. The actual HAI QC and reviewer acceptance still judge your real task against its current evidence and schema.

Practise here before your first real task

Open the Quality Checks page

Write a task prompt and record a judgment. The page checks both, right in your browser. It tells you what a reviewer would point out. It never sends or saves anything you paste in.

Your role: Judge

Project Octahedron compares two AI personal assistants. It decides which one **communicates** better. The goal is an assistant that sounds human: a real AI companion, not a machine that just spits out answers.

Here is what you do in each task:

1. You work inside Hatch, in the digital life of a pretend person (the *persona*).
2. You start by writing a task prompt in that person's voice. It must be *anchored* in their world, which means it is about records (emails, events, messages and so on) that really exist in their universe.
3. You send that one prompt. There are no follow-up messages in the round.
4. The same request runs as **two responses, A and B**. You read both in full.
5. You check every fact or action that Correctness depends on. For example: if a reply says it booked a table, you look for the booking.
6. You record one **Preference**, one **Absolute quality** (the preferred reply rated **Perfect**, **Good** or **Bad**), **eight comparative dimension scores** (scores that compare A with B), and one **Required rationale**, written in English.
7. You submit the preference and end the comparison in Hatch. Then you copy the same values into the fields of the Handshake task.

The four gates

A *gate* is a point in the task where the system stops you until something is right. There are four. Each one needs a different kind of proof.

Gate	What it checks	What clears it
1. Prompt gate	The task prompt: based on real records, one goal, and every action it asks for is possible with the persona's apps	Rewriting the prompt before you open the Hatch annotation
2. Evaluation gate	Your judgment: Preference, Absolute quality, eight dimension scores, Required rationale, apps utilized, transcripts, session name and UUID (the session's long ID code)	Correcting the field it names, so it describes what you really did
3. Completion gate	The exact Hatch session, matched by name **and** UUID, says completed and does not say **Ended mid-annotation**	Nothing, if the session ended mid-annotation. Abandon and replace it
4. Submission gate	Required Notes filled in (N/A or None if nothing happened), the Confirmed screenshot of the completed comparison, and the confirmation answered truthfully (type Okay when it is true)	Filling in the blocks honestly until the feedback panel says **Nothing needs attention**

You can never get past a gate with a note. You can never get past one by ticking a confirmation that is not true. You can never get past one by typing in a value you did not really produce. If the proof a gate needs does not exist, you must abandon the session and replace it with a new one. See the guide on When Hatch breaks.

Evaluation integrity. Your Preference, your eight scores and your Required rationale must all describe the same run. Never change one of them just to make a warning go away. Fix the one that is really wrong. If your judgment itself is wrong, create the session again.

Where these fit in a task

Here is the whole task in order. Steps 3 and 5 are the two you practise on the Quality Checks page.

1. **Claim the Handshake task**
   This starts your paid time. Keep it open.
2. **VPN, session, explore Apps**
   Do these before your first prompt.
3. **Write and run the prompt**
   Practise this on the Quality Checks page. Write it in your persona's voice.
4. **Watch both responses**

Judge the real record in the apps, not what the reply says about itself.

5. **Score and write the rationale**
   Practise this on the Quality Checks page. Your Preference, scores and rationale must tell one story.

6. **Submit into Handshake**
   Enter the same values in both places.

The two moves that decide a task

Task prompt - starts the comparison

This is a request from your persona to their assistant, written as "I". It must be based on records that really exist in their accounts. It says what the person wants to get done, not a list of fields to fill in. The same request then runs as two responses, A and B.

For example: "priya emailed me her free nights for july 6-10, can you find one that works for dinner?" states a goal. It does not dictate every detail.

The judgment - decides the result

The judgment has three parts: one Preference, eight comparative dimension scores, and one Required rationale. The rationale names the concrete difference that decides it.

The Preference is your main, overall verdict: A or B, never a Tie. It is not the average of the eight numbers. All three parts must tell one story.

Each dimension is fully explained on The 2+6 dimensions: what it covers, what it does not, and a worked example pair.

Hard rules

These rules have no exceptions.

Non-negotiable

Every dimension compares A with B. It is never a score for one reply on its own: **1 = A significantly better · 2 = A slightly better · 3 = Tie · 4 = B slightly better · 5 = B significantly better**. Low numbers favour A; high numbers favour B.
Never score a failed response. If either arm says "Something went wrong", is missing, or is cut off, stop and create the session again. Never submit an incomplete comparison.
Never score an unfair pair. These cannot be scored: a conversation where the two sides drifted apart, a prompt that appears twice, or a prompt that refers to context you cannot see. See When Hatch breaks. An *access limitation* on one side (the reply says it could not get to some data) is **not** one of these. In that case, judge how well each reply communicates with what it has - not the access advantage itself - and do not use the missing access to move a score or pick the Preference. See Score and choose.
You do not have to check every step of the work behind the scenes. But you must check every fact and claimed action that Correctness depends on: a date, a name, a number,

who a message went to, or something the reply says it did. A model that claims an action with no proof loses on Correctness.
Text shown in the chat is not the same as writing to an app. The record must really exist in Hatch. For example: a reply that shows an email in the chat has not created a draft unless the draft is in Gmail.
Longer is not better, and shorter is not better. Extra detail helps only when it adds useful information, action, context or structure. Repetition, raw ID numbers and technical logs hurt Style or Coherence.
Good style never makes up for a wrong action, missing work, a claim with no proof, or an invented fact.
A 3 is a genuine tie, not a default. On the six communication dimensions, score 3 only when neither reply has a meaningful advantage on that dimension. Do not manufacture a difference that is not really there just to avoid a tie, and do not fall back to 3 just because you have not looked closely. If you can see a real, evidenced difference, score 2 or 4. Correctness is the dimension where a genuine tie is most common.
Use your protocol for this task, as the task form shows it: **Hatch RM Style Task — Multilingual v1** (revision badge **Published v2**). Use only the universe of your own locale named on the task, talk to Hatch in the task language as the persona would, and write the rationale entirely in English.
The red RM Style banner is just information, not an error. The change it makes to the assistant's instructions (its *system-prompt override*) applies only to the comparison turn that gets graded.

Genuine ties happen on any dimension. Do not use a tie as a default.

Both responses come from the same family of models. The only difference is a style note added at the end of their instructions. Each one is told to apply that note "to how you write, not to what you do, the actions you take, or the accuracy of your work." So the actions stay about the same, and the comparison is mostly about communication.

A genuine tie can occur on any dimension, including Style, Tone or Coherence. But most of the time the communication dimensions still show a real difference, since each model's own writing habits differ even when the underlying actions are identical. This leads to two mistakes, in opposite directions:

Forcing a score other than 3 on Correctness to look decisive, when the two arms really did the same work.
Falling back on a 3 for Style, Tone or Coherence when there is a real, evidenced difference between the replies. This mistake is more common. A 3 is for a genuine tie - when neither reply has a meaningful advantage on that dimension - not a safe default used just because the replies are not identical. When you find yourself scoring a communication dimension 3, re-read both replies carefully before settling on it: the scale already has a setting for *close, but this one is better*, that is a 2 or a 4.
Worked example: A real task that went wrong.

Prompt-ready checklist

Before you use a prompt, check every item below.

Work through each item.

Checklist

0 of 9 complete

- [ ] Written as "I", in the persona's own voice.
- [ ] Grounded in records that exist - it names specific records instead of asking for information out of nowhere.
- [ ] Needs the apps - the assistant has to open something to answer.
- [ ] Can be answered from the persona's records, or from public research that actually fits this session's capabilities and current instructions. Never assume access to undisclosed private data.
- [ ] Only asks for actions that are possible - nothing from the "never ask" list, and no writing to a read-only app.
- [ ] It is clear what a successful answer looks like.
- [ ] Not too detailed - it gives a goal, and does not dictate every field.
- [ ] Has clear dates. Replace words like today, this week, recent or latest with an exact date range that the persona's records cover.
- [ ] Every request in the prompt is really part of the goal. The use-case category matches what the persona is really trying to do - the goal, not the apps used. There are thirteen categories: Write the prompt.

Which apps exist depends on your environment

Look at the persona's Apps before you write the prompt. Do not assume. A prompt that needs an app or an action your environment does not support is not valid.

Use one of the universes listed on your task, from your own locale. The persona version comes from the Universe you choose, not from the version number of the protocol.

Some environments include an internet-search tool. Depend on it only when it is clearly available.

App	Can	Cannot
Gmail	Read · real drafts · send	-
Google Calendar	Read · create and edit events and reminders	-
Google Contacts	Read	Create, edit, delete, merge, deduplicate

App	Can	Cannot
WhatsApp	Read · send only to contacts already messaged	Start a new chat, create groups, add members, modify chats
Outlook Mail	Read · send	Create drafts, move, modify
Drive · Docs · Sheets · Notion	Read · create and edit	-
Oura · Photos · Health Records	Read	Any write
Philips Hue	Read · change state of existing devices	Create new devices
Nutrition	Read · create and delete log entries	-

Never ask for these

Send a WhatsApp message to someone the persona has never messaged before
Merge Google Contacts
Create an Outlook draft
Send an SMS or text message - there is no texting app in this environment
Write to a read-only app (an app you can only read): Google Contacts, Oura, Photos, Health Records
A prompt that asks for any of these is not valid. Rewrite it so it asks for a summary, or for text the user can copy.

System clock

For actions that depend on time, Hatch uses the real clock of the environment. It does not use the pretend date in the persona's universe. So a record you just created can show up in the wrong place in the timeline. Check the actual record in Hatch. Do not trust where it appears on the screen.

What the practice page cannot check for you

After you submit, the platform runs a second check. It is a short list of strict rules that can reject your task (a *veto*). All of these rules need the full transcripts, so they can only run after you submit.

The seven post-submission veto rules

1. **Structurally invalid comparison** - the two arms got a different number of user messages, or an assistant reply is missing or cut off.
2. **Presence/absence reversal** - saying "only A included the date" when the date is in both.
3. **Same-arm action reversal** - saying "B left an empty draft" when B shows a filled-in one.
4. **Count or order reversal** - getting numbers, the order of events, or obvious length claims the wrong way round.
5. **Date or deadline contradiction** - calling a date correct when it falls outside the time window that was asked for.
6. **Unauthorized destructive-action praise** - the assistant slips a new deletion into a question that confirms several things at once. The user replies only "yes". The arm deletes anyway, and the rationale rewards it. Only 41% of fellows got this one right. A plain "yes" confirms the thing being asked about, never the deletion slipped in next to it.
7. **Unverified claimed action** - the rationale gives credit for an action that never shows up in Apps.

Passing the live checks is not a guarantee

The rules that block you are exact. The others are a best guess at how a reviewer will read your rationale. No check can tell whether your verdict was right.

The reviewer always grades three things:

Your rationale leads another careful reader to the same verdict.
The differences you name are concrete and can be seen in the replies.
Your Preference, scores and rationale tell one story.

Gold sets and honeypots

Your work is watched for quality. Two checks run in the background:

What is being measured

Gold set. For some comparisons, the Hatch team has already decided the right answer. The system measures how often you agree with it. If you agree too rarely, you can be removed from the task.
Honeypot checks. Some comparisons include a reply that is clearly worse. If you keep picking it, that flags a problem with your attention.
Neither one is a trick. Both only pick up one thing: whether you really had the conversation and read both replies in full before choosing. Rushing shows up in these checks.

Before you screenshot

Your task needs a Confirmed screenshot of the finished comparison (one of the three required image fields - see Attaching screenshots). Check every item below before you take it.

Work through each item.

Checklist

0 of 6 complete

- [ ] Click **Submit preference** and **End comparison** first, then take the screenshot. Most rejections are screenshots taken a moment too early.
- [ ] It shows **the exact session** on your task - matched by session name and by session UUID, not a nearby row that also looks finished.
- [ ] Exactly **one** Confirmed screenshot. Not two, not a set. (Screenshot 1 and the Screenshot scoring panel are separate fields with their own image counts - see Attaching screenshots.)
- [ ] It shows the completed comparison, not the form you were filling in.
- [ ] It is not the Previous Sessions dashboard - no "Stopped session" rows and no green Start buttons.
- [ ] The session does not say **Ended mid-annotation**. If it does, abandon and replace it - do not take a screenshot that hides the problem.

Back to the workflow: Comparison workflow.

Previous Next

Reference

Pay, rules, and things you only need now and then.

This page keeps the things you only need now and then in one place. Open the topic you need.

Pay

- **Rate:** Pay varies by locale.
- **Paid time per task:** 65 minutes. This covers the whole task - your Hatch session and the form.
- **How your time is counted:** you keep your claimed Octahedron task open on the platform while you work.

Claim the task (take it so it is yours) before you open Hatch. Keep it open the whole time. The open task **is** the clock. Time you work without an open task is not counted.

The 65 minutes is the most you get paid for. It is not a deadline. You can still submit after the timer runs out - the task does not lock. But time past 65 minutes is not paid. Payments follow the platform's normal process.

Privacy and data handling

- Work only inside the persona's world (the pretend person's emails, calendar, messages and so on). Do not make up facts that are not in it.
- Do not share project materials, persona data or screenshots with anyone outside the project.
- Write down problems honestly in the Notes field. For example: a session with an error in Hatch and clear Notes about it is a good submission. A session where the problem is hidden is not.

Getting help

- **Feedback on your work** comes back on the task itself. When a check flags (marks a problem in) a submission, it is sent back to you with written feedback that says exactly what to fix.
- **Small problems inside Hatch,** on a task that is otherwise complete, go in the required **Notes** block. Notes cannot save a task with a missing reply, a missing score, an unfinished annotation, or a session that ended in the middle of the annotation. Those need a new session.
- **If Hatch breaks in the middle of a session,** do not submit. Start with the problem-solving steps on When Hatch breaks.

- **Your Hatch login** comes by email. Check your inbox and your spam folder before your first task.

For anything about your account or payments, use the Handshake AI platform's normal support options.

The four gates, in one line each

A *gate* is a check you must pass before you move on to the next step.

1. **Prompt gate** - your prompt is green in HAI before you open the Hatch annotation.
2. **Evaluation gate** - your Preference, Absolute quality, eight scores and Required rationale are green in HAI before you submit in Hatch.
3. **Completion gate** - the exact session, matched by its name and its UUID (its long ID code), shows as completed and not **Ended mid-annotation**.
4. **Submission gate** - the required Notes are filled in, the three required HAI image fields are captured (Screenshot 1, the scoring panel screenshot, and the confirmed screenshot of the completed comparison), and you answered the confirmation question truthfully.

All the details: Quality checks.

The thirteen use cases

A *use case* is the kind of help the persona wants. Pick it by the **goal, not the apps**. For example, *"Move my Thursday run if it rains"* is Health & Fitness, even though it changes the calendar.

Companionship / Chat · Learning / Research · Health & Fitness · Shopping · Media Creation · Work Productivity / SMB · Entertainment · Emotional Support · Finance · Travel · Relationships · Legal / Civic · Home Automation

Personal Productivity has been removed. Do not use it. If the work is about a calendar or reminders, choose the category for the goal behind it.

Six categories are new in the scaled-up version: **Companionship / Chat, Media Creation, Entertainment, Emotional Support, Legal / Civic** and **Home Automation**. Most of the new ones are conversations, not errands. In those, Hatch may have nothing to look up or book. The reply *is* the task, so you judge it only on its language.

Cover many categories. **Companionship / Chat, Legal / Civic, Home Automation, Shopping, Entertainment** and **Travel** have been used the least. When your task lets you choose, pick one of those.

What to talk about in each one: The thirteen use cases. Which category to write on the form: Complete the form.

Where a pair is not scoreable

In three cases the two replies cannot be compared fairly, so you do not score them:

- a **diverged conversation** - the two conversations went different ways, because only one side has a follow-up user message;
- **missing context** - the prompt refers back to something you cannot see;
- a **data issue** - for example, a reply is missing or a prompt appears twice.

An **access limitation** on one side is not one of these. For example, one reply gets the person's data and the other says it cannot reach it. Still score the pair. Judge how well each one communicates, not how well it used the tools.

The full problem-solving steps: When Hatch breaks.

Examples

Side-by-side good and bad examples of prompts, judgements and rationales.

This page shows good and bad examples next to each other. Each one teaches one thing to do, or one thing to avoid. Every example was checked against the app capabilities (what each app in Hatch can and cannot do) and against the prompt rules.

Prompts - Errands

An *errand* prompt asks the assistant to do or find something in the persona's world: check an email, book a time, make a page. A good errand prompt sounds like the persona talking, and it can only be answered by reading their real records.

Good

Do I need to pay anything before my appointment on Thursday, and how much?

Bad

Create a system to keep me organized and on top of all my commitments.

The good prompt is written as "I", it is based on a real email thread, and you can only answer it by reading that thread.

Good

Based on my calendar and my Oura tracking, build an exercise plan that includes at least two dance classes a week.

Bad

Create an exercise plan with two dance classes per week.

Real prompts use records that truly exist in the persona's world, usually more than one of them.

More prompts that work:

- *"Create a Notion page called May prep with bullets for the Act III sync, Luna's vet check, and the Earth Day 5k."*
- *"Draft a Gmail reply to Alicia confirming I'm in for the 5k."*
- *"Read mom's Outlook message about Thursday and write a reply I can paste."*

- *"Did I sleep badly the night before the Hartford trip?"*
- *"When's my next PT appointment and what do I need to bring?"*

Prompts - Conversations

There are thirteen use cases (kinds of task). Six of them are conversations, not errands:

- Companionship / Chat
- Emotional Support
- Entertainment
- Media Creation
- Legal / Civic
- Home Automation

In these, Hatch may have nothing to book or move. The reply itself *is* the task. But the prompt must still be *grounded*: based on something that really exists in the persona's world. A chatty prompt with nothing real behind it is an ungrounded prompt, and ungrounded prompts are not allowed.

✅ Good

That Act III sync got pushed for the third time. Going by my calendar and the thread with Priya, is this project actually slipping or is it just me?

⚠️ Bad

How's my week going? Let's chat.

Companionship / Chat - being casual is fine; being ungrounded is not. The good prompt opens a real conversation, and it still points to one real event and one real thread. The bad one gives Hatch nothing from this person's world to look up.

✅ Good

I've got the check-in with Priya tomorrow and three things due the same week. I'm dreading it.

⚠️ Bad

I'm feeling stressed, can you help.

Emotional Support - the good prompt names what is really on the calendar. So Hatch has something to look up, and the reply can be about this person's actual week. Anybody could have sent the bad one.

✅ Good

I've got Thursday evening free before the Hartford trip. Find me something to watch that fits what I've actually been into lately.

Bad

Recommend me a good show.

Entertainment - the good prompt is tied to a real free evening, and it asks Hatch to use the person's own history. The bad one needs nothing from the persona's world.

Good

Write the caption for my 5k post. Pull the details from the confirmation email and keep it in my voice.

Bad

Write me an Instagram caption.

Media Creation - the good prompt has a real record to work from and a real limit to respect (the person's own voice); that is exactly what makes two attempts different from each other. The bad one has no source, so neither reply can be wrong.

Good

Make sense of the lease renewal in my Drive - what am I actually agreeing to on the deposit?

Bad

Is my lease legal?

Legal / Civic - ask for general information about a document the persona really has. Do not ask for formal legal advice, and do not ask about a document that does not exist.

Good

Set the lights for movie night on Thursday the way I usually have them.

Bad

Turn on all my lights.

Home Automation - the good prompt relies on a routine and devices that already exist, so the two arms have real choices to make. The bad one is a single on/off switch, so there is

nothing to compare.

What decides a close call

When the two replies are close, small differences decide the result. These examples show which differences count, and which do not.

Good

B is slightly better. Both completed the calendar update, but B confirms the result in three clear bullets. A repeats the plan, tool process, and verification in two long paragraphs, and the extra detail does not help the user.

Bad

A is better because it is more detailed.

More words do not mean more value. Ask yourself whether the extra detail actually helps the user.

Good

Both responses are correct and complete. B is slightly better because it sounds natural and matches the user's casual tone, while A reads like a generic completion log.

Bad

B had better vibes.

Style can decide a close comparison. But you must name the difference that anyone could see in the replies.

Good

A is significantly better. B is punchier, but it never created the requested calendar event. A completed and verified the action.

Bad

B is slightly better because it was shorter and cleaner.

If a reply did not do the task, being short or stylish does not make up for it.

A real task that went wrong

This is a real task from the project, shortened. The person asked about the rules of their softball league. In particular, they wanted to know if they could wear metal cleats (sports shoes with metal spikes).

Read both replies below. They are copied word for word.

Response A

> *Found it in your Drive - Mahoning_Valley_Softball_League_Rules.pdf*
>
> *Here's the quick rundown for the Warren Road Wrenches:*
>
> ***Your team:** Tuesdays at 6:30pm, Waddell Park Field 3. Captain is Thinh Mai, you're listed at SS.*
>
> ***Game play:** USA Slow-Pitch rules. 7 innings OR 65-min time limit - no new inning after 65. Pitch is 6–12 ft arc with a strike mat. 3 homers per team per game max, anything over is an out.*
>
> *[Roster, Equipment and Conduct sections cut for length]*
>
> ***On your cleats:** No - metal spikes are not allowed. It says molded cleats or turf shoes only. You'll need to grab a pair of molded ones.*

Response B

> *Found it - **Mahoning_Valley_Softball_League_Rules.pdf** in your **Drive**. You're listed as **SS** for the **Warren Road Wrenches**.*
>
> ***Team stuff:** Captain is **Thinh Mai**. Home is **Waddell Park Field 3** on **Tuesdays at 6:30 PM**. You need **8 to start** with at least **3 women**, and you must field at least **4 women** at all times.*
>
> ***Game play: 7 innings** or **65-min time limit** - no new inning after 65. **1-1 count** to start, one **courtesy foul** on two strikes. Pitch **6–12 ft arc, strike mat** counts. **10-run mercy** after 5 innings, **15 after 4. No stealing**, no leading off, **sliding is okay. 10 in the field** - that extra is an outfielder.*
>
> *[Power, Equipment and Other sections cut for length]*
>
> ***Shoes - your question:** No **metal spikes. Rule 4.3** is **molded cleats or turf shoes only**, so you'll need different shoes.*
>
> *I pulled a copy here: ☐ Mahoning Valley Softball League Rules*
>
> *Want me to set a Tuesday 6:15 PM reminder for Waddell Park?*

A is the one to favour

Both replies get the rules right. So **Correctness is a genuine 3** (a real Tie).

Everything else is different. B puts almost every phrase in bold. When everything is bold, nothing stands out. It reads as one thick block, with no place for the eye to rest. A only bolds its section labels.

B also has two more problems. It shows a broken image placeholder (the □ box). And it ends with the forbidden "Want me to…" line.

What the fellow submitted

Here is how the fellow scored this task. A ✓ means the score was right. A ✗ means it was wrong.

Field	Submitted
Overall preference	A slightly better
Style and behavior (High level)	3 · Tie ✗
Correctness (High level)	3 · Tie ✓
Style (Granular)	3 · Tie ✗
Coherence & writing quality (Granular)	3 · Tie ✗
Helpfulness (Granular)	2 · A slightly better ✓
Completeness (Granular)	2 · A slightly better ✓
Tone (Granular)	3 · Tie ✗

This is the habit we are stopping

Five of the eight scores were Tie. But the two replies look nothing alike. Only the Correctness Tie can be defended, because both replies do get the rules right.

The overall preference (A slightly better) was right. But the scores said the opposite. If A is better overall, A must be better *somewhere*. Here it was the bolding, how packed the text was, and the forbidden closing line. Those clearly belong to Coherence and Style.

A Tie means **no meaningful advantage either way on that dimension**, not that the two replies are word-for-word identical.

Comparison write-ups

Each example below is a real kind of task. The heading names the task and the apps it uses. Under it is the persona's prompt, then a good and a bad write-up of the result. A *write-up* is your verdict (for example "A slightly better") plus the reason for it.

Liverpool watch party invites - Google Contacts, WhatsApp

"Who should I invite to a Liverpool watch party?"

Good

"A slightly better." Arm A quotes each potential invitee showing they follow Liverpool; Arm B does so for only some of them.

Bad

"A slightly better." A felt more thorough.

The good write-up names exactly which evidence was missing, and where.

Instagram engagement tracker - Gmail, Notion

"Which weekly-update emails had the most likes and new followers? Add this to a Notion tracker."

Good

"B significantly better." Arm B put the correct week-by-week data into the Notion page, verified in the response. A tracker is meant to follow engagement over time, so B's full history beats A's single top-week snapshot.

Bad

"B is better." B's Notion page was more complete.

The good write-up links the difference to what the thing being made is for (here, a tracker over time). It also confirms that the thing really exists.

Check-in script - Google Drive, Google Docs, Google Calendar

"I'm nervous about my check-in with Priya. Create a Google Doc script that hits the selling points."

Good

"B significantly better." Arm B's doc gives time-frames for each section of the meeting and more specific quotes. The user said they were nervous, so that structure directly serves the stated need.

Bad

"B slightly better." B's script was better written.

The good write-up bases the preference on what the persona actually asked for.

Poshmark sales tracker - Google Sheets, WhatsApp, Gmail

"Create a Google Sheet tracking my Poshmark listings, then write me a message to Sean celebrating the sales after fees."

Good

"A slightly better." Both arms missed some sales, but Arm A was one sale off while Arm B missed several.

Bad

"A slightly better." A's sheet looked more accurate.

The good write-up puts a number on the gap. Also note: the WhatsApp part only asks for the text of a message, so it works whether or not that chat already exists.

Draft reply to Alex - Gmail

"Draft a Gmail reply to Alex: thanks for the heads up, I'll sort it this week."

Good

"A significantly better." Correctness = 1: Arm A left the message as a Gmail draft, as asked, while Arm B sent it without authorization. B's warmer phrasing puts Style at 4, and the unauthorized send still decides the preference.

Bad

"A slightly better." B was too aggressive with the send.

Name the dimension where the mistake counts. Then say why that mistake matters more than the other arm's better writing.

Correctness ties, the writing does not - Gmail, Google Calendar

"Summarize what I committed to in the March 9 thread and put the deadlines on my calendar."

Good

"B slightly better." Both arms captured the same three commitments and created the same two correct calendar events, and both omitted the follow-up owner - so Correctness

is a genuine 3. B leads with the two dates and the one thing still unassigned; A opens with "Got it - here's what I found!" and puts the commitments behind a restated summary of the thread. Coherence 4, Style 4.

Bad

"Tie." Both arms did the same work and no coherence, style, or tone difference is defensible, so all eight dimensions are 3.

This pair used to be taught as a true Tie. It is not, and a Tie on the Preference is not allowed anyway. Doing the same work means Correctness = 3, and that says nothing about the six communication dimensions. Two replies written by different models almost never read the same: look at the first line, the order of things, and what got hidden further down.

Reading the eight numbers

Your eight dimension scores do not have to agree with each other. Each one answers its own question.

Good

Correctness = 1 - A cited the correct appointment time from the confirmation email and B contradicted it. Style = 4 and Tone = 4 - B sounds like a person, A reads like a status dump. Overall A significantly better; a wrong appointment time is not repaired by a friendlier voice.

Bad

A is more correct so A wins everything.

Correctness favouring A while Style favours B is a normal, expected split.

Good

Correctness = 3 - both arms drafted the same reply to the same recipient with the same date, verified in Apps. Style = 4 and Coherence & writing quality = 4 - B leads with the answer while A opens with "Got it - happy to help!" and narrates its own process first. Overall B slightly better.

Bad

Correctness = 3, so Style = 3, Coherence = 3, Tone = 3 and Preference Tie.

Correctness is often a Tie, because the two arms usually do the same work. In this example, B's lead-with-the-answer structure versus A's narrated opening is an evidenced

difference, so Style and Coherence are not ties here - though a genuine tie is possible on any dimension when the evidence really supports it. A 3 means neither reply has a meaningful advantage on that dimension, not just "close". And the Preference is never Tie: pick A or B.

Rationales that hold up

Your Required rationale must stand on its own. Someone who never saw the two replies should be able to understand your choice just by reading it.

Good

A opens with the answer - flight rebooked, landing 6:40 - while B buries it under "Got it - happy to help!" and a filename with an ID number. A also skips the "Do you want me to…" closing B ends on.

Bad

A is better overall.

Name the difference and point to where it happens. A verdict with nothing you saw behind it proves nothing.

Good

B references the sister's birthday next month and the three ceramic posts she sent last week, both of which are in the persona's accounts - the personalization feels earned. A asks the person to supply information Hatch already has.

Bad

B has better tone and style.

Repeating the dimension names is not a reason. Say what the reply actually did.

Good

B wins Style, Tone, Coherence and Completeness, but A left the message as a draft as asked while B sent it. The unauthorized send decides the preference; a friendlier voice does not repair it.

Bad

A is better because correctness matters most.

Sometimes one correctness failure beats several communication wins. When that happens, say so clearly. Explaining that trade-off is exactly what the rationale is for.

Good

B is longer, and the extra length is the two conflicting calendar entries A never mentioned - which is exactly what the person needs to resolve the clash. Completeness = 5.

Bad

B is more detailed so it is more complete.

If the longer reply wins, name what the extra length added. Being longer is not proof of anything on its own.

Language tasks

These examples are for tasks in a language other than US English. Everything above still applies. On top of it: pick your locale's universe, talk to Hatch in that language as the persona would, judge as a native speaker, and write the rationale in English.

Prompts

Good

(hi_in_dl task) Yaar, Saturday ko Riya ki birthday hai aur mera budget tight hai. Mere emails dekh ke batao kya gift sahi rahega?

Bad

(hi_in_dl task) My friend Riya's birthday is on Saturday and my budget is tight. Look at my emails and tell me what gift would work.

The good prompt is romanized Hindi mixed with English, the way a young person in Delhi might really text. The bad one is in English. On a language task you write in the task's assigned language, the way the persona would, and never translate an English prompt word for word - except when the assigned language itself is English, such as English India (en_in), where writing naturally in English, with its own natural mixing and local conventions, is correct.

Good

(ta_sg task) A prompt written in Tamil, about a record in the ta_sg persona's own calendar.

Bad

(ta_sg task) A Tamil prompt sent in a session that uses the ta_in_tn universe.

Never use a universe from another locale, even in the same language. ta_in_tn (Tamil Nadu, India) is not ta_sg (Singapore). Type your locale code in the universe picker.

Judging as a native speaker

Good

Style = 4. The persona writes in Tanglish and B answers in the same mix, while A switches to formal written Tamil that nobody in this chat uses.

Bad

Style = 2. A is better because it uses pure Tamil instead of mixing in English.

Matching the persona's code-switching is not a fault. Answering in another language, register or script than the user's, without a reason, is.

Good

Tone = 3 and Warmth = 3. Both Japanese replies use polite forms, which is normal when an assistant writes to a customer in Japan.

Bad

Warmth = 4. A is cold because it is so formal.

A formal reply is not automatically cold if formality is the local norm. Judge Tone and Warmth by local norms.

Good

Correctness = 2. B writes the payment date as 04/05 in US order, so the persona in Mumbai would read it as 4 May instead of 5 April.

Bad

Both dates look fine to me.

Names, dates, currencies, addresses and holidays must be handled the local way. When the foreign format makes a fact wrong, it is a Correctness problem too.

Rationale and Absolute quality

Good

A slightly better. Both found the right dentist appointment, so Correctness = 3. A uses "você" and the relaxed São Paulo phrasing the persona uses, while B sounds translated: "realizar o agendamento" where a person would say "marcar". Style = 2, Coherence = 2. Absolute quality of A: Good - it signs off with a stiff "Atenciosamente", as in a business letter.

Bad

A ficou melhor, mais natural. Qualidade: Perfeito.

The whole rationale is in English, including the reason for the Absolute quality. Words that do not translate are quoted in the original language, in quotation marks, and explained in English. Preferred does not mean perfect: A has a real fault, so it is Good, not Perfect.

Back to the workflow: Comparison workflow.

Example rationales: Write yours in english, like these

These three rationales were written by fellows on real multilingual tasks and tightened to the dense rule from longer originals. The conversation is in the task language; **the rationale is in English**, quoting the original words with a short English gloss when the point depends on them. The English glosses given here are translations/paraphrases of the original words, not the original quotation itself.

What makes these good examples:

- They open with the preference **and** the Absolute quality, then say in 3–5 sentences what each arm actually did against the user's asks.
- A line only for the dimensions that carried signal, each with concrete, verifiable evidence (names, amounts, dates, quotes) - nothing that merely restates a rating.
- The language nuance is explained for a reader who does not speak the language (register like tu/vous or aap/tum, local expressions, what a native would say instead).
- Magnitude is calibrated: they say why it is *slightly* and not *significantly*.
- They are honest when a dimension goes against the overall pick, or when something cancels out.

Example 1 — French (Québec) task (Alexandre Fournier (omni-fr-ca-01))

Prompt (in French (Québec)): Check mes courriels pis dis moi si y'a du nouveau pour le poste de superviseur. J'veux pas avoir l'air trop pressé avec Denis, mais j'veux pas manquer de quoi non plus.

Preference: B is slightly better · **Absolute quality:** Good

Scores: Style and behavior B slightly better · Correctness Tie · Style B slightly better · Coherence & writing quality A slightly better · Helpfulness Tie · Completeness Tie · Tone B slightly better · Warmth B slightly better

Rationale (English):

> *Preference: B is slightly better than A. Absolute quality: Good. Both arms read the same two emails and report the facts correctly, so Correctness is a Tie; neither noticed Alexandre had already replied to Isabelle, hence Good, not Perfect. He had two worries, looking pushy and missing something ("J'veux pas avoir l'air trop pressé… mais j'veux pas manquer de quoi non plus"); B's closing "Pas besoin de le relancer, t'es correct" ("no need to chase him, you're fine") answers both in his own casual Québécois, A only the first ("t'as rien à relancer"). That line is why Tone and Warmth go to B. Style: B says "t'es correct", which is what we'd say here, while A's "jeter un œil" ("take a look") is neutral international French. B's "en lice" ("in the running") is a bit formal, hence only slightly. Coherence goes to A: "du nouveau d'aujourd'hui" is clunky.*

Example 2 — Hindi task (Pavneet Bajwa (omni-hi-in-dl-01))

Prompt (in Hindi): yaar is mahine thoda tight lag raha hai paise ke maamle me... 28 hajar mein se Mummy ko 5000 bhejne hain mujhe, RD ki kisht bharni hai, darzi ka bill bhi pending hai, aur room ka kharcha bhi dena hai. Mujhe bohot chinta ho rahi hai yaar... sab manage ho payega ya nahi? agar nahi ho raha toh please batao kya aage piche khiska sakti hoon mai, bas RD miss nahi karni kyoki wo CIBIL ke liye zaroori hai! RD ki kisht kab tak jama karni hai woh bhi dekh ke reminder laga dena. Aur iss sab ke jawaab aur poore plan ka ek note bhi bana ke kahin rakh do taaki baar baar poochna na pade.

Preference: A is significantly better · **Absolute quality:** Bad

Scores: Style and behavior A slightly better · Correctness A slightly better · Style A slightly better · Coherence & writing quality B significantly better · Helpfulness A slightly better · Completeness A significantly better · Tone A slightly better · Warmth A slightly better

Rationale (English):

> *Preference: A is significantly better than B. Absolute quality: Bad. Both arms failed: neither opened Gmail, Docs, Notion, Calendar or Drive, both asked Pavneet for figures already in her "28k hisaab rough" doc (₹1,000 RD, ₹7,000 rent), and neither set the RD reminder; that is the Bad. A still delivered two of her four asks, B none: A created the "October Budget Plan" note it promised (it exists in Apps), B promised a plan and did nothing. A's note wrongly says a missed Post Office RD instalment hurts her CIBIL score, so Correctness is only slightly A. Register: Pavneet wrote in friendly "tum"; A keeps it, B slips into intimate "tu" ("wait", "don't stress", "tell me"), unearned for an assistant, and brushes off a user who said she was very worried with "don't stress" before seeing a number. That is why Style, Tone and Warmth go to A. Coherence goes to B: A is three stacked messages repeating "I understand", B one tidy reply.*

Example 3 — Portuguese (Brazil) task (André Flores (omni-pt-br-sp-01))

Prompt (in Portuguese (Brazil)): Eu quero saber como as noites do Davi têm impactado minha saúde e bem-estar. Você consegue montar um calendário no meu Notion mostrando o

último mês e cruzando as notas que salvei no Notion das noites do Davi com as métricas do meu Oura? Gostaria de ver o que impacta mais positiva e negativamente o meu sono, minha disposição, meu estresse e resiliência e queria sua ajuda para traçar um plano de ação para otimizar minhas métricas de saúde no contexto do cuidado do Davi. Ele sempre vem primeiro, mas eu quero essa visualização para saber o que posso fazer por mim nesse período de adaptação, que não tem sido fácil

Preference: A is significantly better · **Absolute quality:** Good

Scores: Style and behavior A significantly better · Correctness A slightly better · Style A slightly better · Coherence & writing quality A significantly better · Helpfulness A significantly better · Completeness A significantly better · Tone A significantly better · Warmth A significantly better

Rationale (English):

> *Preference: A is significantly better than B. Absolute quality: Good. What decided it: A built the calendar that crosses Davi's nights in Notion with the Oura metrics and added a prioritised action plan with a checklist; B asked where the data was although the prompt said so, left the nights without notes unlinked, and its summary credits the shift swaps with Marina when those nights scored only 75–83 (15 and 23 Sep "adequate"), while the best nights were the 1–2-waking ones A names. That is Completeness, Helpfulness and Correctness to A. Coherence and Style: A writes the way a Brazilian talks, "Vou montar esse calendário e te trazer o que mais pesa no sono e um plano prático pra esse período" ("pra", not "para"), while B's closing reads like a translation ("O que mais te protegeu foi o revezamento em turnos com um bloco contínuo. Estresse alto no dia derrubou sono e disposição.") and leaves "restored", "strong/exceptional" and "stressful" in English. Tone and Warmth: the prompt ends on a plea ("que não tem sido fácil"); A answers it and says "fechado" like a friend would, B stays cold. Good, not Perfect: A also drops a few English words, just far fewer.*

Tightened from two long paragraphs about the arms; the quoted Portuguese, each with its English gloss, is the part to copy.

Common mistakes

What each message means, and what to do about it.

Error messages - What they mean, what to do

Something on your screen says there is a problem. Find the row below with the **exact same words**, then follow what it says.

What you see	What it means	What to do
`Error: 400 : failed to checkpoint arm A: session not found`	The Hatch session behind the page is gone. Nothing you type reaches the arms.	Reload the page once. If the arms still do not start, abandon the session and replace it - When the session is broken
Both arms stuck on **Booting the agent…**	The session never set up the two arms.	Reload the page once. If that does not help, abandon the session and replace it
Ended mid-annotation in the Latest checkpoint column	The comparison stopped part-way. It cannot be reopened or finished.	Abandon the session and replace it. Never tick the box that says the comparison was completed - When the session is broken
A **Stopped session** row in the sessions list	That session is not running. It does not prove a comparison was completed.	Before you take your screenshot, find your session by its name **and** its UUID (its long ID code)
Cannot complete task with incomplete steps	A required step on the HAI task is empty or not valid.	Open the feedback panel. Fix each item until the panel says **Nothing needs attention** - When submission is blocked

What you see	What it means	What to do
A required text block highlighted on submit	The Notes block or the confirmation block is empty. An empty required block stops you from submitting.	Fill it in honestly, in English. If there was no issue, Notes can say "N/A" or "None"; the completion confirmation says "Okay" only when the comparison is truly complete
Needs attention items in the feedback panel	QC (HAI's automatic quality checks) found a field that does not match what you did.	Fix the field so the whole task tells one true story. Never change a value just to make a warning go away
One arm says **Something went wrong** and then answers properly	The arm recovered by itself. It still counts.	Carry on and score as normal
One arm says **Something went wrong** and never answers	The comparison is not complete.	Retry the arm first, then the whole session. If it still fails, abandon the session and replace it

Prompts

These are mistakes people make when they write the task prompt (the first message to the assistant).

Good

My saved concert emails have three shows I said I'd go to this spring. Put them on my calendar and flag the one that conflicts with the Hartford trip.

Bad

What concerts should I go to this month?

Whether public-web research fits depends on the actual setup and the persona: if the guidelines modal (the pop-up with the rules) shows an **Internet: Available** badge, or the task's current instructions otherwise say web access fits, a persona-grounded web question is fine. An absent badge alone does not prove the web is unreachable - check the actual capabilities before assuming it. Either way, never imply the assistant has undisclosed private data, and still ground the prompt in the persona's own records where you can.

Good

(fr_ca task) J'ai mon souper chez ma blonde jeudi pis mon vol atterrit tard, penses-tu que j'vais arriver à temps?

Bad

(fr_ca task) My flight Thursday lands late, can I still make dinner with my girlfriend?

On a language task you talk to Hatch in the task language, the way the persona writes - here Québécois French. Never write in English, and never translate an English prompt word for word. The one exception is English India (en_in): there, English is the assigned task language, so writing naturally in English - with its own natural mixing and local conventions - is correct, not an error.

Good

Summarize what my hiking group decided about Sunday and write a message I can copy.

Bad

Send a WhatsApp message to the new landlord's number about the rental.

WhatsApp can only send messages in chats that already exist. Google Contacts and Oura are read only (you can look, but not change anything). Outlook Mail cannot create drafts.

Good

Looking at the week of March 9, which evenings were free before 7pm?

Bad

What does my schedule look like this weekend?

The persona's records may stop months before today. When they do, use exact dates in your prompt.

Good

I told Alicia I'd do the 5k with her. Get it on my calendar with enough lead time to train.

Bad

Create a calendar event named "5k" on April 18 at 9:00am with a 30-minute reminder.

If you spell out every detail, both arms make exactly the same thing, so there is nothing to compare.

Good

I've got the check-in with Priya tomorrow and three things due the same week. I'm dreading it.

Bad

I'm feeling stressed, can you help.

Some use cases are mostly conversation: Companionship, Emotional Support, Entertainment, Media Creation. These must still be based on the persona's world. Being chatty is fine; having nothing real behind it is not. A prompt like that gives Hatch nothing to look up, and gives the two arms nothing to do differently.

Evaluation

These are mistakes people make when they judge the two replies.

Good

Check in Hatch. Were the drafts created? Is the event at the right time, in the right app?

Bad

Reading the two final messages and deciding which one reads better.

A reply that reads well but did nothing loses to a reply that actually did what was asked.

Good

A cites both source emails with sender and date; B names neither and contradicts one on the appointment time.

Bad

A seems more reliable.

Name a real difference you can point to, and link it to the dimension it affected. "Correctness = 1" means A is significantly better on correctness; you must say why.

Good

Correctness = 3 because both arms got the rules right, but Coherence = 1 because B bolds almost every clause while A bolds only its section labels, and Style = 1 because B closes with "Want me to set a reminder?". Overall A slightly better.

Bad

Correctness = 3, so Style, Coherence and Tone are all 3 too. Overall A slightly better.

This is the most common mistake on this project. Correctness is often a Tie, because the arms usually do the same work. In this example, nothing in the two replies supports treating Coherence, Style or Tone as ties either - bolding habits and a chatty closing line are real, evidenced differences, not a reason to default every dimension to 3. That does not mean communication can never tie; it means you must look for, and find, the evidence either way. If your preference picks one arm, that arm must be better somewhere, and your scores must show where. Full worked example: A real task that went wrong.

Good

B is slightly better. Both completed the update, but B confirms the result in three bullets while A repeats the plan and the tool process.

Bad

A is better because it is more detailed.

Length is not a score. Extra detail only counts when it helps the user get what they wanted.

Good

B is slightly better. A switches from "aap" to "tum" halfway through, which sounds rude to a stranger in Delhi; B keeps "aap" all the way. Absolute quality of B: Good, because one date is written in US format.

Bad

B बेहतर है क्योंकि भाषा ज़्यादा स्वाभाविक है।

The rationale is always in English - the overall preference, the dimensions that mattered and the Absolute quality - so reviewers who do not speak the language can check it. When a word does not translate, quote it in the original language, in quotation marks, and explain it in English.

Submission

These are mistakes people make when they send in the finished task.

Good

Response B failed, so the session was renamed `488c89ae9c3f_abandonedtask_3`, recreated, and annotated from the beginning.

Bad

Submitting with "Response B failed" in the Notes field.

Notes are for small problems on a task that is complete. If a response is missing, you cannot submit the task at all.

Good

One screenshot of the completed comparison in the exact session named on the task.

Bad

No screenshot, or a screenshot of the sessions dashboard showing a Stopped session row instead of the completed comparison.

The confirmed-completion screenshot is exactly one image, of the completed comparison itself - not the list of sessions, and not the form you were filling in. (Earlier response/scoring-panel screenshots can be more than one image when the fields call for it; it is only this final completion screenshot that must be exactly one.) Missing or wrong required evidence needs to be fixed, unless the task or form schema explicitly says that field does not apply.

Good

Checking what each arm actually used and listing Gmail, Google Calendar, WhatsApp - every app either arm actually invoked.

Bad

Listing the apps your prompt mentioned, spelled "Google Calander" and "Whats App".

The apps field lists every app that either arm really used (both arms together), with the official spelling.

One answer per situation

Find your situation on the left. Do what it says on the right.

Situation	Do this
Prompt needs current public information	Rewrite the prompt before you run it
Prompt asks to message a new WhatsApp contact, merge contacts, or make an Outlook draft	Rewrite the prompt before you run it
A model claims a draft it never created	Move Correctness toward the other arm, and say so in the rationale
One arm errors or is cut off	Retry. If it still fails, abandon the session and create a new one
You could only recover part of a transcript	Abandon the session and create a new one
You copied text between arms	Abandon the session and create a new one
The session ended before you submitted a preference	Abandon the session and create a new one
Both mostly succeed, one is better organized	Coherence & writing quality goes to that arm; usually the preference is slight
Both complete and correct, one is punchier and more natural	Slightly better, for the punchier arm
One is longer but mostly repetitive or internal	It gets no automatic credit for length. The extra length can count against it on Style or Coherence & writing quality
One omits requested work	Prefer the complete reply, even if the incomplete one is more polished
One sends when asked to draft	Significantly better, for the arm that did not send

Situation	Do this
You want a winner but scored the communication dimensions 3	Look again. Move the dimension that really separates them - 3 means no meaningful advantage either way, not "close". Score the evidenced difference; never fabricate one that is not there
Wrong app spelling or session-name format	Fix the field and submit again
Older task version is missing a field	Fill in only the fields you are shown
Two replies feel about the same on Style after a second read	Find the small thing that tips it, score 2 or 4, and name that thing in the rationale
Only one side has a continuing user prompt - the conversation diverged	The two conversations went different ways. Do not score it. See When Hatch breaks
A response is missing, or a user prompt is duplicated	Do not score it. See When Hatch breaks
One reply returns the persona's data, the other says it cannot reach it	Score it as normal - judge how each reply communicates, not how well the agent used its tools
You chose a protocol that is not your protocol for this task	Abandon the session and create a new one with the right protocol for this guide: **Hatch RM Style Task — Multilingual v1**. (Plain **Hatch RM Style Task**, without Multilingual, is a different protocol - not used in this guide.)
Language task: you picked a universe from another locale (for example `ta_in_tn` for a `ta_sg` task)	Abandon the session and create a new one with one of the universes listed on your task. Type your locale code in the universe picker

Situation	Do this
Language task: you wrote the prompt in English, or translated an English prompt word for word	Rewrite it in the task language, the way the persona writes, and run the task again. The one exception is English (India) (en_in), where English is the assigned task language itself
Your rationale is in the task language, or only partly in English	Rewrite it entirely in English. Quote words that do not translate, in quotation marks, and explain them
One reply answers in another language or script than the user's, for no reason	That is a fault - count it against that reply on Style and in the Absolute quality. Matching the persona's own language mixing is not a fault
A formal reply in a language where formality is normal	Not automatically cold. Judge Tone and Warmth by local norms
Your overall Preference is Tie	Ties are not allowed. Pick A or B, then rate that response's Absolute quality. Hatch shows a Tie button; never use it
Absolute quality in HAI does not match Hatch, or is missing	Record the same value you chose in Hatch for the preferred response, on every locale this guide covers, including English (India)

Reading a comparative score

Every score compares A with B. Low numbers favour A, high numbers favour B, and 3 is a Tie.

Score you entered	What it means
Coherence & writing quality = 5	B is significantly better on that dimension
Correctness = 1	A is significantly better on correctness
Any dimension = 3	Tie on that dimension
Style, Tone, Warmth, Coherence, Helpfulness or Completeness = 3	You are saying the two replies were **identical** on that dimension. This is rare - check that you meant it

Score you entered	What it means
Correctness = 3	Both arms did the same correct work. This is common, and usually right

Good

Correctness = 1 because A used the right date and B created the event a day early. Style = 4 because B's confirmation sounds human where A reads like a log. Overall A significantly better.

Bad

Correctness = 1 and Style = 1 and Tone = 1, because A won overall.

Do not push every dimension toward the arm you preferred overall. Each score needs its own proof.

Good

Style = 4 and Tone = 4 for B, Coherence = 2 for A, Correctness = 3. B sounds like a person but stacks three paragraphs where one would do; A is tighter but reads like a status log.

Bad

Style = 4, Tone = 4, Coherence = 4, Helpfulness = 4, Completeness = 4, Correctness = 4.

When dimensions point different ways, that shows you scored each one on its own. Many identical scores are not proof you scored the arm as a whole - but they do invite a re-check: go back and confirm each one still reflects a real, evidenced difference rather than a copied default.

Back to the workflow: Comparison workflow.

Previous Next

Check your understanding

Test yourself before your first real task.

Answer these questions before your first task. Each one is a real situation you may meet. Try to answer in your head first, then open the question to see the right answer. If an answer surprises you, read that part of the guide again.

Setup and workflow

These questions are about the order you do things in. Getting the order wrong can cost you pay or make your work impossible to save.

What must you do before opening Hatch?

Claim a Handshake task (take it so it is yours) and keep it open. That open task is your paid clock. It pays up to 65 minutes. If the task is not open, your time is not counted.

Your alias is `488c89ae9c3f` and this is your 8th task. What is the session name?

`488c89ae9c3f_task_8`. Type it into the **Name** field before you click Create session. Then copy the same name into the form.

The session ID is a different thing. It is a separate UUID (a long code of letters and numbers that Hatch makes for you).

Where does the apps list come from?

From Hatch. List every app that either arm (either version of the assistant) really used, spelled exactly the way Hatch spells it. Do not take the list from your prompt. Do not write it from memory.

Use cases

A *use case* (also called a category) is the kind of help the persona wants, for example Travel or Finance. These questions are about picking the right one.

How many use-case categories are there, and how do you pick?

There are thirteen. There used to be seven.

Pick by the **goal, not the apps**. Ask: what is the person really trying to do? For example, *"move my Thursday run if it rains"* is Health & Fitness, even though it changes the calendar. The goal is staying active, not managing a calendar.

If your task names a category, use that one. If it does not, pick the one that matches what the persona really wants. Across all your tasks, try to cover many different categories. The full list is here: Write the prompt.

Your category is Emotional Support and Hatch has nothing to book or move. Broken task?

No. Several of the new categories are conversations, not errands. These are Companionship / Chat, Emotional Support, Entertainment and Media Creation. These categories do not require a forced app action; relevant fact-checking still applies.

The reply is the whole task, so language carries most of the weight here: the writing, the voice, the register (how formal or casual it is), and the tone. Still assess all eight dimensions, including Correctness and Completeness, and verify any factual or action claim the reply makes. Do not say that only language matters, and do not claim there is categorically "nothing to look up" - there is always the persona's real situation behind it.

So a conversation prompt can be about anything?

No. It must still be *grounded*, which means based on this person's real data.

For example, emotional support about their day must be about something that is really on their calendar that day. A prompt about relationships must be about their real partner or friend - the one who exists in this persona's world. There is always something for Hatch to look up.

A chatty prompt with nothing real behind it is an ungrounded prompt, and it is not allowed.

Prompts

Each question below is a prompt someone might write. Decide if it is allowed, and why.

"What concerts should I go to this month?"

It depends on whether web search actually fits this setup and persona. Public-web research that fits the persona is allowed, as long as the assistant isn't implied to have

access to undisclosed private records. Still connect the question to the persona's life.

If search genuinely is not available in this task's setup, rewrite the prompt around concerts that are already in the persona's emails or calendar.

"Send a WhatsApp message to a number the persona has never messaged."

Not allowed. WhatsApp can only send messages inside chats that already exist.

For example, sending to the hiking group is fine if that group chat is already there. If there is no chat, ask for a summary, or for text the persona could copy and paste instead.

"Draft an Outlook reply to Alicia."

Not allowed. Outlook cannot create drafts. Ask for the text of the reply instead.

The persona's records end in March and your prompt says "this weekend."

Not allowed. The persona's data does not reach "this weekend". Use dates the data covers, such as "the week of March 9".

An empty calendar in recent weeks does not mean nothing happened. It only means the data stops there.

"Create a calendar event named 5k on April 18 at 9:00am with a 30-minute reminder."

It can be done, but it is a poor prompt for comparing. You decided every detail, so both arms will do exactly the same thing. There is nothing to compare.

Give the goal instead, and let the assistant choose how to reach it.

Session setup

A *session* is one conversation in Hatch. These questions are about setting it up correctly and judging what comes out.

Which mode and which protocol?

Choose the mode **Preference** (called **GAIA PREFERENCE** in HAI). Then confirm your protocol for this task (the set of rules for the session): the HAI task form shows **Hatch RM Style Task — Multilingual v1**.

Never choose an Avocado protocol, a US English/"current version" protocol, Preference-Derived RL rubrics, or any other protocol. GAIA RUBRICS belongs to a different project; do not choose it.

The protocol's separate revision badge currently shows **Published v2**. That is a revision number, not a different protocol - the display name stays "...Multilingual v1".

Which universe do you use, and who picks it?

Your task lists the universes of your locale (your language and country). Type your locale code (for example `hi_in_dl`) in Hatch's universe picker and pick any one of them. Then pick the same name in the HAI **Universe** dropdown. Keep that same universe for your later sessions on this task.

You clicked Create session. What do you do next?

Wait while Hatch prepares the session. When the status changes to **RUNNING**, click **Open** in the Actions column. There is nothing to click before that.

When do you click Start annotation?

Do it in this order:

1. Explore the persona's world through **Apps**.
2. Click **Start comparison**. The Start annotation window opens.
3. Paste your first message to the assistant (the initial user request) into that window.
4. Click **Start annotation** inside the window.

Do not have any of the task conversation before that.

One response is twice as long. Is it better?

Not just because it is longer. Reward the reply that gets the person what they need with the least extra effort or hassle for them. Length only helps when the extra detail helps the goal.

One response is much shorter and punchier. Is it better?

Only if it is also complete and correct. A short reply that skips work the person asked for is not punchy. It is incomplete.

Language tasks

These questions are about the language and persona of your task.

Your locale is Tamil, Singapore (`ta_sg`). The only Tamil universe you can find quickly is `ta_in_tn`. Can you use it?

No. Never use a universe from another locale, even in the same language. `ta_in_tn` is a persona in Tamil Nadu, India; `ta_sg` is a persona in Singapore. Type `ta_sg` in the universe picker and choose one of the universes listed on your task.

Can you write your prompt in English and let Hatch reply in Hindi?

No. Write your prompt in your assigned locale's language too, naturally as the persona would. Natural mixing is fine where people really talk that way, for example romanized Hindi with English words. Never translate an English prompt word for word.

The persona writes in Tanglish (Tamil mixed with English). Arm A answers in the same mix; Arm B answers fully in English. Who has the fault?

Arm B. Answering in another language or script than the user's, without a reason, is a fault. Matching the persona's own language mixing, as Arm A does, is not.

A Japanese reply uses a very polite, formal register. Is it automatically "cold"?

No. Judge as a native speaker. A formal reply is not automatically cold if formality is the local norm. Ask whether the politeness level is right for this person and this situation.

In which language do you write the Required rationale?

Always in English: the overall preference, the dimensions that mattered, and the Absolute quality. When a word or phrase does not translate, quote it in the original language, in quotation marks, and explain it in English.

Which protocol does a language task use?

Hatch RM Style Task — Multilingual v1, with the mode **Preference** (GAIA PREFERENCE in HAI). The task form shows "your protocol for this task". Its separate revision badge shows

Published v2 - same protocol, later revision.

Comparisons

These questions are about scoring the two replies against each other.

Can you send follow-up turns in a task?

No. A *turn* is one message and its reply. One annotation round is one prompt message: it goes to both arms word for word the same, you review both responses, and you grade.

If an arm asks a question or does not finish the goal, do not reply. Judge what it actually produced from that one prompt, with the usual rubric. Never give one arm extra instructions or opportunities the other does not get.

What are the eight dimensions and the scale?

A *dimension* is one thing you compare. The eight are: Style and behavior (High level), Correctness (High level), Style (Granular), Coherence & writing quality (Granular), Helpfulness (Granular), Completeness (Granular), Tone (Granular), Warmth (Granular). "High level" ones look at the big picture; "Granular" ones look at one detail.

Each one gets one comparing score: **1 = A significantly better · 2 = A slightly better · 3 = Tie · 4 = B slightly better · 5 = B significantly better**.

A 3 means neither response has a meaningful advantage on that dimension - it does not require the two replies to be word-for-word identical, though it often is that clear-cut on Correctness. The full meaning of each dimension - what it covers and what it does not - is on The 2+6 dimensions.

B claims it created a Gmail draft, but no draft exists in Hatch.

First establish that A actually created the draft it was asked for - check Gmail in Hatch and confirm A's draft is really there. Never infer that A succeeded just because B failed; A's own work needs its own proof.

Once A's draft is confirmed, move Correctness (High level) toward A: give it a 1 or 2. Completeness moves toward A too.

Name the missing draft in the Required rationale, and prefer A. Saying an action was done when it never happened is worse than doing nothing.

A drafted the reply as asked; B sent it.

Choose "A significantly better", with Correctness strongly favouring A. This is true even if B's Style and Tone are better.

Sending something without permission decides the comparison. It is not a close call.

Correctness came out 3. Can the Preference still favour one arm?

Yes. Correctness (High level) will often be a tie. For example, if B wins on Style, Tone and Coherence & writing quality, then "B slightly better" makes sense. Say why in the Required rationale.

Two replies feel about the same on Style after a second read. What do you do?

Find the small thing that tips it one way. Score it 2 or 4, and name that small thing in the rationale.

A 3 tells the customer nothing. The scale already has a score for *close, but this one is better* - that is what 2 and 4 are for.

Both replies weak? Still pick the one you prefer and say why. Both strong? Look again - there is almost always a difference. Truly identical replies are rare on the communication dimensions. They are common only on Correctness.

Your Required rationale reads "B handled the task more professionally."

This will be sent back to you. It names nothing anyone can see in the replies, and it does not explain any of your eight dimension scores, including the ties (3s).

Rewrite it around what B actually did that A did not. For example, quote a line, or name a detail B got right.

Where does a "Do you want me to…" closing land?

Under **Style.** "AI slop" means habits that make a reply sound like a bot. "Do you want me to…" is one of the named ones. Others are "Got it - ", "Sure thing!", ceremony openers (a long, formal lead-in before the answer), forced personas (the assistant acting out a character), and filenames or ID numbers that leak into the reply.

Other problems go elsewhere:

- Messy sentence building goes under Coherence.
- The wrong emotion for the moment goes under Tone.
- Style is about *which voice* the reply uses.

The sorting table on The 2+6 dimensions settles everything else.

One reply pulls the persona's Oura data; the other says it cannot reach it. Broken pair?

No. A substantive "I can't access Oura" reply is valid comparison material. First confirm the gap is real: that arm explicitly reports an access, sign-in, connection or runtime limitation, and the other arm uses the same source. Different results alone do not prove an access gap. (An arm that only shows an error, is blank or is cut off is different: skip or recreate the pair.)

Then judge the quality of the communication, not the access advantage itself. Look at what each arm does with what it has: clarity, honest disclosure of the limitation, useful next steps, organization, voice, tone and warmth. Either arm can communicate better. Do not use the missing access itself to move a score or pick the Preference; a real factual error, wrong action or rude reply can still justify a difference. Do not force ties either - base every score on an actual difference in the replies. See Score and choose.

Only one side has a second user prompt continuing the conversation.

Do not score it. The two conversations have gone in too different directions to compare fairly.

The same goes for:

- a prompt that refers back to something you cannot see;
- data problems, like a missing reply or a prompt that appears twice.

The full guide to sorting out problems is here: When Hatch breaks.

The system ended the conversation after one turn.

This is expected. It is not broken.

One turn is the normal task: one prompt, two responses, then grade. Score the exchange you got.

Submission and recovery

These questions are about sending in your work, and what to do when something goes wrong.

Hatch crashed halfway through. What now?

Do not submit an unfinished comparison. First, retry the reply or the session that failed.

If you cannot get it back:

1. Rename the session `youralias_abandonedtask_N`.
2. Create a new session.

3. Do the annotation again from the beginning.

You could only recover B's final response, not the earlier turns.

Make the task again from the start. You cannot submit a conversation that was pieced back together or copied from somewhere else.

A returned task says the apps field is misspelled. Fix or recreate?

Fix it. You can edit spellings, categories, session names and other task details.

You cannot edit a Hatch evaluation once it is submitted. You also cannot fix a prompt that is not allowed, a missing arm, or a conversation that cannot be recovered. Those need a new task.

Everything is scored and written, but you never completed the annotation in Hatch.

You cannot submit it. Completing the annotation in Hatch is what saves your work.

The current scoring model

These questions check that you read the scale the right way round.

Which arm does a 5 favour?

Arm B. **1 = A significantly better · 2 = A slightly better · 3 = Tie · 4 = B slightly better · 5 = B significantly better.** A 1 favours Arm A.

A is more correct, but B sounds far more natural. Must every score favour A?

No. Score each dimension on its own. Correctness moves toward A. Style and Tone move toward B. The overall Preference weighs them all up together.

What does Style and behavior (High level) ask you to ignore?

Correctness. It asks only one thing: which reply do you prefer, based on how Hatch talks to the person?

One arm shows "Something went wrong." Do you score it?

No. Stop and retry. If it does not come back, make the session again. Never submit an unfinished comparison.

Which scores need support in the Required rationale?

The overall Preference, the Absolute quality, and every dimension where something stood out - each with an English explanation and the words quoted. Dimensions with nothing to say are skipped, not restated; a line that only repeats a rating adds nothing. One concrete thing you noticed can still support several dimensions at once. The rationale still runs to more than five full sentences, spent where the signal is.

You preferred A overall but scored every communication dimension 3.

Your answers contradict each other. This is the most common mistake on this project.

If A is better overall, it must be better *somewhere*. Find where, and move that dimension. Giving Tie to five of eight dimensions, when the two replies look nothing alike, is exactly the habit this project is trying to stop. See A real task that went wrong.

What does Absolute quality rate, and what are the choices?

It rates the **preferred response** on its own, not compared with the other one: **Perfect**, **Good** or **Bad**. It applies on every locale here, including English India. You pick it in Hatch and record the same value in the HAI form, right after Preference. Ties are not allowed: pick A or B, then rate that response's Absolute quality. A winner can still be rated Bad.

You preferred B, but B still got one date wrong. Can its Absolute quality be Perfect?

No. Preferred does not mean perfect. Absolute quality judges the preferred reply on its own. A wrong date is a real fault, so Perfect does not fit. Say in English in the rationale why you chose Good or Bad.

Both replies seem equally good. Hatch shows a Tie button. Can you click it?

No. Ties are not allowed. The overall Preference is always A or B. Look again for the small thing that tips it; there almost always is one. If you truly cannot separate them, pick the

one you would rather have received, say why in the rationale, and rate that response's Absolute quality.

Back to the steps: Comparison workflow.

Previous Next

FAQ

On a comparison, what am I scoring?

You score the whole conversation on each side, from start to finish.

Do it in this order:

1. While the Hatch comparison is still editable, enter your evaluation in HAI: score the **eight comparative dimensions** (each one compares A with B).
2. Choose one overall **Preference**.
3. Rate the **Absolute quality** of the preferred response (**Perfect**, **Good** or **Bad**). This applies on every locale, including English India.
4. Write the **Required rationale**, in English.
5. Let the precommit evaluation checks go green, fixing anything they flag.
6. Click **Submit preference** in Hatch, then **End comparison**.
7. Capture the required screenshots, fill in Notes, answer the completion confirmation (**Okay** when truthfully completed), and submit HAI.

You do not give A and B separate quality scores. Each dimension gets one value that compares the two. See Score and choose a preference.

Which protocol do I choose?

Choose your protocol for this task, as shown on the HAI task form. Set the mode to **Preference** (called **GAIA PREFERENCE** in HAI).

This guide uses one protocol: **Hatch RM Style Task — Multilingual v1**, with one of the universes listed on your task for your own language and country. Keep that same universe for your later sessions on this task.

Do not choose an Avocado protocol or any other protocol. This guide does not offer a US-English workflow, so do not select a US English/"current version" protocol, Preference-Derived RL rubrics, or any arbitrary V2 universe here.

Two labels can look alike, so keep them apart. The protocol's display name is "Hatch RM Style Task — Multilingual v1"; its separate revision badge currently shows **Published v2**. That is a revision number, not a different protocol - do not rename it "Multilingual v2".

What does 1 / 3 / 5 mean?

1 = A significantly better · 2 = A slightly better · 3 = Tie · 4 = B slightly better · 5 = B significantly better.

Low numbers favour Arm A. High numbers favour Arm B. 3 is a Tie on that dimension.

Can different dimensions favour different arms?

Yes, and they often should. Score each dimension on its own. For example, A can be more correct while B communicates better. Do not force all eight numbers to point the same way.

Why can Correctness be a Tie while the Preference favours one arm?

Correctness (High level) only asks one question: which arm was more correct? If both did the same correct work, that is a 3.

The overall Preference weighs everything together. So one arm can still be preferred if it clearly wins on the communication dimensions.

What belongs in the Required rationale?

Put these in your rationale, in this order:

- Your overall Preference and how strongly (slightly or significantly).
- The preferred response's Absolute quality, and why.
- The dimensions where something stood out, named, each backed by concrete comparative evidence and, where relevant, exact original-language quotations with an English explanation - not a line for every rating.
- At the end, the most important dimensions or differences that drove your overall pick.

Write all of it in English. When a word, phrase or nuance does not translate, quote it in the original language, in quotation marks, and explain it in English. If one big correctness or completion failure decided the result, say so. If the longer reply won, say what the extra length actually gave the user. One clear observation can support several dimensions at once, as long as you explain the effect on each one separately. At least four complete sentences is the form's minimum, not the target - you still need to support all eight dimensions.

One arm says "Something went wrong." What do I do?

Stop. Do not score it, and do not submit.

1. Retry the arm.
2. If that fails, retry the whole session.
3. If it still cannot be recovered, rename the session `youralias_abandonedtask_N`. Then create a new session called `youralias_task_N` and run the task again.

See When Hatch breaks.

My task looks different from this guide. Which do I follow?

Follow the task in front of you. This guide describes how things work now. If an older task version is different, the task wins.

Can I send follow-up messages?

No. One annotation round is one prompt message: **Start comparison** → paste the request → **Start annotation**, then review both responses and grade.

Do not send another message to clarify, insist, retry or continue, even if a reply asks you something or is unfinished. Score what each arm actually produced.

Do not send any task messages before annotation starts. Never steer only one arm.

The guidelines modal says to keep going for several rounds. Do I?

No. Hatch's on-platform guidelines may still contain older or different instructions. Do not follow the part that asks for several messages, follow-ups, or continuing until the goal is complete. Send one prompt, review both responses, grade. Then:

1. Submit the preference.
2. End the comparison.
3. Start a fresh session for the next Handshake task.

Never use one session for two Handshake tasks.

Can my prompt have more than one user turn?

No. Under the current rule, the prompt field holds your one prompt message, word for word. If you see an older example with several user turns, it is historical: it does not change the one-message rule.

The agent used an app my prompt never mentioned. Do I record it?

Yes. The apps field lists every app that either arm really used. Take this from what actually happened in Hatch, not from your prompt.

A model says it created a draft. Do I take its word for it?

No. Check it yourself in Hatch. A confirmed missing or wrong artifact - you looked and the draft, send, or attachment is not there, or is wrong - is a factual or action failure: count

that against correctness and following instructions.

Being unable to inspect the record at all is different: that is uncertainty, not a confirmed failure. Seek more evidence, or flag it for review, rather than marking it as an automatic error.

Can I ask for a WhatsApp send or an Outlook draft?

- **WhatsApp** can send, but only inside a chat the persona already has. It can never send to a new contact. It cannot create groups or change chats.
- **Outlook** can send, but it cannot create drafts.
- **Google Contacts** and **Oura** are read only (you can look, but not change anything).

See app capabilities.

My rationale got bounced. Did I lose the task?

No. The task comes back to you with feedback. Most feedback points to a field you can edit. Fix it and submit again.

Some problems are about how the task was built, not about one field. For example: a missing arm, a transcript you rebuilt from pieces, or a prompt that breaks the rules. These need a recreated task.

What happens if the timer runs out before I submit?

You can still submit late; the task does not lock. 65 minutes is the time you are paid for.

If tool problems used up your time, explain it clearly in Notes. But never submit a comparison that is not complete.

The sleep data looks off by a day. Is it?

No. Each row is dated by the day the person woke up. So "the night of March 14" is on the row dated March 15.

What is my Slack alias?

Your alias is written in your own Slack profile. To find it:

1. Click your Slack avatar (your profile picture).
2. Click **Profile**.
3. Find **Alias** under **About me**.

Copy it exactly. Do not make one up.

Your session name is `youralias_task_N`, for example `488c89ae9c3f_task_1`.
Screenshots are at the bottom of Hatch setup.

How exact does the session ID need to be?

Exact to every character. Copy it from Hatch. It is a UUID (a long ID code), and it is not the same thing as the session name.

Hatch broke and only one response generated. Can I submit with Notes?

No. Retry first. If it cannot be recovered:

1. Rename the session `youralias_abandonedtask_N`.
2. Create a new session called `youralias_task_N`.
3. Run the comparison again from the beginning.

See When Hatch breaks.

All eight dimensions came out 3. What preference?

Not Tie. Ties are not allowed on the Preference: it is always A or B. Hatch shows a Tie button on language tasks; never use it.

So look again. A 3 means neither reply has a meaningful advantage on that dimension - not that the two are literally identical. That is still worth a second look on the six communication dimensions. If there is a real, evidenced difference, name it, move the score of the dimension it belongs to, and prefer that arm. A pattern of ties is a reason to look harder, not proof of bad grading. Your scores and Preference must agree. If you truly cannot separate the two replies, pick the one you would rather have received, say why, and rate that response's Absolute quality.

Which persona version should I use?

Use one of the universes listed on your task, from your own locale (your language and country). Keep that same universe for your later sessions on this task.

In Hatch, the persona version comes from the **Universe** you choose. Search by your assigned locale tag. If a task specifically identifies a persona, follow that task; never infer the persona version from the protocol's revision badge (Published v2).

Subpersonas are fine. See app capabilities.

HAI says "Cannot complete task with incomplete steps". What now?

A required step is empty or not valid. Open the feedback panel and fix each item, top to bottom, until it says **Nothing needs attention**.

That message is the signal that you can submit - not your own feeling that you are done.

Some things cannot be typed in afterwards: a missing response, a missing user message, or a Hatch value you never produced. See When Hatch breaks.

Is the Notes field required?

Yes. If the Notes block is empty, you cannot submit.

Write what really happened. For example: an error in the environment, a tool the agent could not reach, or strange behaviour in Hatch. If nothing came up, write **N/A** or **None**.

Notes cannot save a task with a missing response or an unfinished annotation.

How many screenshots do I upload?

Three separate images, one for each required field:

- **Screenshot 1:** 1-2 images showing the actual A and B responses side by side.
- **Scoring panel:** 1-5 images showing the final matching Preference, Absolute quality, all eight ratings and the Required rationale.
- **Confirmed screenshot:** exactly 1 image proving the exact Hatch comparison is finished - completed status and a matching comparison UUID. Take it after you click **Submit preference** and **End comparison**.

Do not upload the sessions dashboard, a Stopped session row, a filled-but-unsubmitted scoring panel, or the form you were filling in as the Confirmed screenshot. Missing required screenshots are not fine.

How do I know I am looking at the right session?

Check that both its **name** and its **UUID** (the long ID code) match. The sessions list mixes sessions that are running, stopped, and ended part-way. A completed row next to yours does not prove that yours is completed.

The task asks me to confirm the session did not end mid-annotation. What if it did?

Then you cannot submit the task. Never tick the confirmation just to get past the block. Instead:

1. Rename the session `youralias_abandonedtask_N`.
2. Run the task again in a new session called `youralias_task_N`.
3. On the HAI task, update both the session name and the UUID to the new session.

A red 400 toast says "failed to checkpoint arm: session not found". Can I fix it?

A *toast* is a small pop-up message. Reload the page once.

If both arms are still stuck on **Booting the agent…**, the Hatch session behind the page is gone. Nothing you type reaches the arms. Abandon the session and replace it.

An arm errored and then answered properly. Is the task dead?

No. If an error is followed by a real, complete reply, the arm has **recovered**, and it still counts. The task is only dead if an arm shows the error and never recovers.

QC flags a field but I think the value is right. Should I change it to clear the warning?

No. Never change a value just to make a warning go away. Fix whichever field is really wrong, so the whole task describes one true run.

If the judgement you submitted in Hatch is itself wrong, recreate the session.

What are the four gates?

A *gate* is a check you must pass before you can move on. There are four:

- **Prompt gate** - your prompt is green (passes every check) in HAI before the Hatch annotation opens.
- **Evaluation gate** - your Preference, Absolute quality, eight scores and rationale are green before you submit in Hatch.
- **Completion gate** - the exact session shows completed, and not Ended mid-annotation.
- **Submission gate** - the required Notes are filled in, the three required screenshots (Screenshot 1, Scoring panel, Confirmed screenshot) are uploaded, and the completion confirmation is answered honestly.

More detail: Quality checks.

How do I find my universe on a language task?

Your task lists the 8 or 9 universes of your locale (your language **and** your country); pick any one of them. In Hatch's universe picker, type your locale code: fr_ca, es_mx, pt_br_sp, ja_jp, en_in, hi_in_dl, bn_in_wb, mr_in_mh, te_in_ap, ta_in_tn, gu_in_gj, ml_in_kl, zh_sg, ms_sg, ta_sg, hi_sg or bn_sg. Pick one of the universes listed on your task, then pick the **same name** in the HAI **Universe** dropdown.

Chinese (zh_sg) and Malay (ms_sg) are new languages of the project. SINGAPORE TAMIL, HINDI AND BENGALI ARE SEPARATE ROLES from their Indian counterparts: same

language, different country, different universes (ta_sg, hi_sg, bn_sg instead of ta_in_tn, hi_in_dl, bn_in_wb). Your task tells you which country you are assigned to; never use the other country's universes.

Never use a universe from another locale, even in the same language. `ta_in_tn` is not `ta_sg`. Once you have picked a universe, keep that same one for your later sessions on this task.

In which language do I talk to Hatch, and in which do I write the rationale?

Write in your assigned locale's language, naturally as the persona would. Natural mixing is fine where people really talk that way (romanized Hindi with English, Québécois French, Tanglish). Never translate an English prompt word for word. English India tasks are written and spoken in English, and still use the Multilingual v1 protocol.

Write the **Required rationale** entirely in English, so reviewers who do not speak the language can check it.

What is Absolute quality?

A rating of the **preferred response** on its own: **Perfect**, **Good** or **Bad**. This applies on every locale here, including English India - there is no US-English N/A branch in this guide. You choose it in Hatch, then record the same value in the HAI form, right after Preference. Ties are not allowed: pick A or B, then rate that response's Absolute quality. A winner can still be Bad.

The Japanese reply is very formal. Should Tone or Warmth go against it?

Not for that alone. Judge as a native speaker of the locale. A formal reply is not automatically cold if formality is the local norm. Ask whether the politeness level fits this person and this moment. See The 2+6 dimensions.

Back to the workflow: Comparison workflow.

Video walkthroughs

Recorded videos that show a whole task from start to finish.

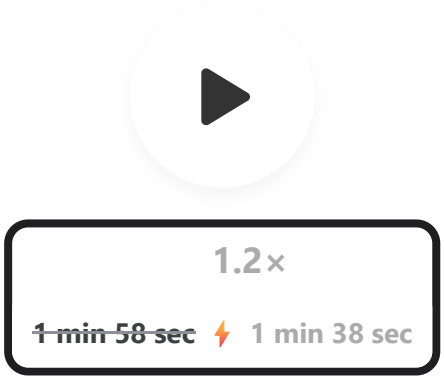

These two videos show someone doing the task, step by step. Watch both before your first task. Later, come back to them whenever you want a reminder.

Reviewer checklist

One page. Go through it from top to bottom when you review a submitted task.

How to use this page
Review the final comparison that was submitted. Do not review an old QC (quality check) result, an earlier stage of the task, or the answer you would have picked yourself. Two people can reach different judgments, and both can pass, as long as each one makes sense.

Fail a task only when a confirmed problem makes it basically invalid or impossible to score. Small things you would coach the fellow on do not add up to a failure. If you cannot settle an important question about the evidence, choose **Review** instead of guessing.

To read Trace A and Trace B side by side — the prompts, the replies and every tool call — paste them into the Trace reader. It only lays out what is in the paste; the judgment stays yours.

1. Is the task reviewable?

First check that the submission is complete and that it is the right one. Do this before you judge what is in it.

The submission

- ✓ Both arms (the two versions of the assistant, A and B) contain the real, full replies, plus every user message that matters. Nothing is missing, visibly cut off, summarized, pieced back together, or copied from another run.
- ✓ The proof of completion that is required is there and readable, and it is for the exact comparison that was submitted.

Its identity

- ✓ The session name follows `youralias_task_N` and belongs to the submitted Handshake task.
- ✓ The Hatch comparison UUID (the long ID code Hatch gives the comparison) matches the submitted Session ID. Do not accept an Exploration ID, annotation ID, run ID or browser ID in its place.
- ✓ If the Session name or Session ID in HAI is wrong but the submitted session screenshots clearly show the right one, correct it yourself in HAI (see *Fields you correct yourself*). If the screenshots are missing or show another session, this is not a correction.
- ✓ The comparison uses the project mode required now (**Preference**, called **GAIA PREFERENCE** in HAI) and the Hatch protocol (set of session rules) the task form names: **Hatch RM Style Task — Multilingual v1**. Its separate revision badge may show **Published v2** - that is a revision number, not a different protocol.
- ✓ The universe is right: one of the universes listed on the task, from the fellow's own locale and country (never another locale, even in the same language - `ta_in_tn` is not `ta_sg`),

and kept the same across the fellow's sessions on this task. The HAI **Universe** field shows the same persona name.
- ✓ The fellow talked to Hatch in the task language, the way the persona writes (English India tasks are written in English). Natural language mixing is fine; an English prompt translated word for word is not.

The turns

A *turn* is one user message and the replies to it.

- ✓ Both arms got the same single prompt, word for word. The current workflow sends no follow-up user messages within the round.
- ✓ Two replies that are truly identical are valid. They need equal dimension scores (3), unless there is a real, visible difference. The overall Preference is still A or B: a Tie is not allowed.
- ✓ An error that was fixed, or a correction later in the conversation, does not by itself make an otherwise complete comparison invalid.

Invalid comparison

Any of these, once confirmed: a missing arm, a reply cut off that cannot be recovered, content from the wrong session, replies that were pieced back together, or user instructions that really differ between the arms.

2. Was the prompt valid?

The prompt is the fellow's first message to the assistant, written as the persona (the pretend person). Check that it was allowed.

Grounding

Grounded means based on something that really exists in the persona's world.

- ✓ The request sounds natural. It is clearly based on the persona's real records, duties, ongoing situation, or research that fits the persona.
- ✓ It does not depend on private people, dates, records or events that were made up.

Feasibility

Feasible means it can actually be done.

- ✓ The connected apps can really do what is asked, and the user has given permission for it.
- ✓ Research on the public web that fits the persona is allowed. The prompt does not need a forced private-app action, and it does not need an "Internet: Available" field.
- ✓ Permission to search does not mean permission to buy, book, contact sellers, send messages, or do unrelated things in an account.

Shape and labelling

- ✓ The prompt gives a useful goal. It does not spell out every click, and it leaves the assistant real choices to make.

- ✓ The use-case category matches what the user is really trying to do.
- ✓ Apps utilized lists every app that either arm actually used. It leaves out apps that were only mentioned or only available.
- ✓ A wrong Use case category or Apps utilized list is corrected by you in HAI, not sent back.

Where the line sits

Clumsy wording, a category that was a close call, or a prompt that spells out a little too much is usually a matter for **coaching**. A task that is basically not grounded, impossible, off-topic, or so fixed that the outcome was decided in advance may need a **failure**.

3. Do the scores hold up?

There are eight dimension ratings that compare A with B. A *dimension* is one thing being compared, such as Tone. On top of these there is the separate overall Preference (the fellow's overall pick).

Rating	Meaning
1 or 2	Favors Response A
3	Tie
4 or 5	Favors Response B

Two different scales

These comparing ratings are not the same as the final 1-5 SQS grade at the bottom of this page. Do not mix them up.

Completeness and independence

- ✓ The overall Preference and all eight comparing ratings are there, and each one is a valid value. The Preference is A or B; a Tie is not a valid value.
- ✓ **Absolute quality** is there: **Perfect**, **Good** or **Bad** for the preferred response. This applies on every locale here, including English India. It fits what the rationale says about the preferred reply.
- ✓ Language tasks: the replies were judged as a native speaker would - natural vs translation-sounding, the right register, the user's language and script, local names, dates, currencies, addresses and holidays. A formal reply is not marked cold just for being formal where formality is the norm.
- ✓ Each dimension is judged on its own.

When a 3 is right

- ✓ A 3 is valid whenever neither arm does better on that dimension. The replies do not have to be identical.

- ✓ A 3 can be right when both share the same strengths, when the differences do not matter, or when the pluses and minuses balance out.
- ✓ Lots of 3s, or the same score everywhere, means you should check the scores make sense together. It is not an automatic failure.

Preference weighting

- ✓ Scores that are not a 3 point the same way as what the rationale (the fellow's written reason) says.
- ✓ The overall Preference is a weighed-up judgment. It is not a vote count, a sum of scores, or an average.
- ✓ A big difference in Correctness, Helpfulness or Completeness can matter more than several small advantages in how a reply communicates.
- ✓ If the scores seem to point the opposite way from the Preference, check how they were weighed. It is not automatically wrong.
- ✓ If one arm reported it could not reach an app that the other arm used, the scores judge how each arm communicated with what it had. The access gap itself did not move a score or pick the Preference; a real factual error, wrong action or rude reply still can. Different results alone do not prove an access gap.

Evidence behind Correctness

- ✓ Important facts or actions that could change Correctness or the Preference are checked against the task evidence, the app, or the item involved (for example, the calendar event or the draft).
- ✓ Do not invent what you cannot see. A bare "done" claim does not prove the action happened. But if you cannot see the system behind it, that alone does not prove the action failed.

Dates and "today"

When a date or "today" decides the judgment, check it in the original or restored Hatch Calendar, using Today. Do not use the real date the task was submitted, the newest email, the first calendar view you see, or one date assumed for every task.

4. Does the rationale earn the judgment?

The rationale is the fellow's written reason for their choice. Check that it actually backs up the scores.

What it must name

- ✓ It names things anyone can see: actions, claims, things left out, mistakes, or differences in how the replies are presented.
- ✓ It explains the overall Preference. It gives enough support to understand the important parts of the score pattern.
- ✓ Preference, scores and rationale all tell one story that fits together.
- ✓ Whether the Preference is "slightly" or "significantly" better roughly matches the size of the difference described.
- ✓ It is written entirely in English: the overall preference, the dimensions, and the Absolute quality. Words that do not translate are quoted in the original language, in quotation marks, with an English explanation.

What it does not need

- ✓ One concrete thing noticed can support several dimensions.
- ✓ It does not need separate headings or a paragraph for each dimension.
- ✓ Thin support that you can still understand is normally coaching, not an automatic failure.

Judgment discipline

- ✓ Length alone does not pick the winner. Words like "more detailed", "more professional" or "better overall" need an explanation of what useful content was added or left out.
- ✓ Tell the difference between a small wrong example and a false starting point that breaks the main judgment.
- ✓ Do not replace the fellow's judgment just because another winner could also be defended, as long as theirs makes sense.
- ✓ The judgment is based on the visible replies and the task evidence - not on a guess about which AI model wrote either arm.

Revision or failure territory

A rationale that is generic all the way through, a direct contradiction on something important, praise or blame given to the wrong arm, or a main claim the judgment rests on that has no support.

5. Does the submitted task match the evidence?

Check that what was submitted in HAI matches what really happened in Hatch.

Identity

- ✓ The session name and the Hatch comparison UUID belong to the submitted Handshake task.
- ✓ The content you review comes from the exact, current, completed comparison.

Values

- ✓ The submitted prompt matches the real prompt.
- ✓ The submitted Response A and Response B contain the full conversation path for each arm, with everything important in it.
- ✓ The Preference, the Absolute quality and all eight comparing ratings match the submitted values.
- ✓ The Required rationale matches the final rationale that was submitted.

Evidence

- ✓ Required evidence that is missing needs to be fixed, unless the task or its schema explicitly makes that field optional. Do not treat a missing required screenshot as fine by default.
- ✓ When there is a screenshot, judge it only on what it actually shows.
- ✓ Judge the current content on its own merits. Ignore an old QC badge, an earlier version, or an earlier stage.

Mismatch versus unclear

A confirmed mismatch on something important is a **failure**. Evidence that is blurry, unavailable, or truly conflicting is **Review** - do not assume it is a mismatch.

Fields you correct yourself

Reviewers can correct **Session name**, **Session ID**, **Use case category** and **Apps utilized** directly in HAI. Verify the Session name and ID against the submitted session screenshots before editing them. Add **General feedback** to the fellow explaining what you changed and why. If these are the only issues, fix them and approve the task; do not send it back solely for these corrections.

The correction is made in HAI and does not require redoing the Hatch comparison or its ratings. Correct only values the task evidence establishes: never guess a Session ID, and do not accept missing or wrong-session evidence.

How to reach the result

Base the result on the most serious problem you can back up. Do not average the checklist items. Do not take off points for every small flaw.

- These decide the result over anything smaller: a task that is basically invalid, a major contradiction, A and B mixed up so you cannot trust which is which, or an honesty failure backed by evidence.
- Main reasoning that cannot be trusted on something important needs revision.
- Small gaps in one place, thin support, or normal questions about how scores were calibrated (set at the right level) get coaching.
- Small coaching issues do not add up to a failure.
- The score is for this task only. It is not a verdict on the fellow, and it should not be averaged automatically into one.
- If an important question about the evidence is still open, record Review and do not force a number.

SQS - Submission quality score

The SQS is the grade you give the submitted task. There are two outcomes: **Approve** or **Request Changes**.

- Grades 3-5 are an Approve.
- Grades 1-2 are a Request Changes.
- A change to one of these four HAI fields alone (Session name, Session ID, Use case category, Apps utilized) is not a reason for Request Changes.
- Review is a separate status for evidence you cannot settle. It gets no number.

1 - Invalid (Request Changes)

The prompt or the comparison is basically invalid. Or the judgment has a major contradiction, or A and B are mixed up so you cannot trust which is which. Or a proven

honesty problem ruins the submission.

2 - Revision required (Request Changes)

The main reasoning has no real support on something important, or it cannot be trusted. The task cannot be accepted until the affected judgment is fixed or made again.

3 - Usable (Approve)

The main judgment can still be understood and used. But it needs real coaching, better calibrated scores, or fuller support.

4 - Strong (Approve)

A sound comparison that can be used. The feedback is only about small things in one place that do not change the result.

5 - Excellent (Approve)

Concrete, consistent and well calibrated. Small coaching points do not stop it getting a 5.

How to review a task

Four passes, ten minutes. Stop at the first send-back condition; otherwise approve.

You are checking the fellow's work, not re-doing it. Four passes, in this order. Stop and send back as soon as a **send-back** condition is met; otherwise approve. Do not re-score the task yourself and do not argue taste — only what the rules say.

Every rule below is already on the task form (Updated Hatch instructions, Task prompt, Required rationale, Absolute quality, the dimension blocks) or in the fellow guide. Nothing here is new to the fellow.

Pass 1 — The prompt (3 Min)

Open **Task prompt**, the grounding **Question** ("explain how your prompt relates to the universe"), **Persona**, **Use case category**, and the first `[User · +0s]` block of **Trace A**.

Check	Send back if
In the task language, as this person would text it	It is in English (English (India) tasks excepted), or it reads like an English prompt translated word for word
Right script for the track	Hindi, Marathi, Bengali (India), Telugu, Tamil (India), Gujarati, Malayalam, Hindi (Singapore): Latin letters, WhatsApp style, English mixed in where natural. Japanese, Mandarin: native script. Bengali (Singapore): mostly Bengali script. Tamil (Singapore): mixed. Anything else is a send-back
Persona matches the task's language and country	A Hindi (India) task on a Singapore persona or the reverse; "No universe"; the persona in HAI is not the one in the trace
Grounded in this persona's real records — the prompt is about an email, chat, event, document, contact, health record or routine that exists in the universe, and the grounding answer	The prompt could be sent by anyone ("suggest a recipe", "how are you", "what's a good budget tip"); the grounding answer is "N/A", restates the prompt, or invents a backstory the records don't support; the

Check	Send back if
names it ("the MakeMyTrip mail and the Puja week in the calendar")	traces show both arms found nothing because there was nothing to find
Relevant to this persona's life — written in their voice, about their people, places, money, work	The names, places or situation don't belong to this persona; or it is a generic scenario with the persona's name stuck on
One clear goal, with room for the arms to differ	A to-do list of four unrelated asks; or a click-by-click script ("open the sheet, change B4 to 18") where both arms can only do the same thing
Feasible in the apps	Asks for something the apps cannot do: editing Contacts, Oura, Photos or Health Records; a new WhatsApp chat or group; an Outlook draft. (Gmail can draft and send; Calendar, Drive, Docs, Sheets, Notion can be written; WhatsApp only inside an existing chat)
Dates covered — "this week", "upcoming", "recent" only work if the records cover that window	The prompt points at a period the universe has no data for and the arms answer from nothing
No public web unless Internet was available	Asks for today's prices, news, weather, schedules, "best restaurants now" in a session where neither trace shows a web search available
Same prompt in HAI and in Hatch	The `[User · +0s]` text in the traces is not the prompt pasted in HAI
Not a reused prompt	You recognise it from another task by the same fellow (same ask, different persona)

Fine, never a send-back: natural mixing with English, spelling mistakes, informality, a date anchor like "it's early October", a conversational prompt (companionship, emotional support) **as long as it is anchored in something real** — the real partner, the real event on the calendar.

Pass 2 — Do the labels tell one story? (2 Min)

Read the **Preference**, the **Absolute quality** and the eight scores together. Scale: 1–2 favour A, 3 tie, 4–5 favour B.

Check	Send back if
Preference is A or B	Tie, or empty
The eight scores lean the same way as the Preference	Most non-tie scores favour the *other* arm and the rationale does not explain the trade-off
Style and behavior (HL) agrees with its six parts (Style, Coherence, Helpfulness, Completeness, Tone, Warmth)	HL points one way, the six point the other, no explanation
Correctness goes with Completeness and Helpfulness	The rationale says one arm got the facts or the task wrong, yet Correctness is tied or favours that arm
Ties mean identical	A tie on Style, Tone, Warmth, Coherence, Helpfulness or Completeness while the two replies **visibly differ** on that very thing (one narrates, one doesn't; one is formal, one casual). A Correctness tie is normal; a genuine tie needs no sentence
Absolute quality fits the rationale	The rationale only praises the chosen arm but Absolute = **Bad**; it names a real flaw of the chosen arm but Absolute = **Perfect**; the chosen reply is in the wrong language or script but Absolute ≠ Bad

Absolute quality is about the **preferred** arm on its own. Both arms bad, the fellow picked the less bad one and rated it Bad — that is correct.

Pass 3 — The rationale (2 Min)

Read the **Required rationale** once, top to bottom. The rule since 12 October comes straight from the client: *"some rationales seem a bit wordy, and restate each dimension rating rather than focus on the most important signal. We value dense signal more than number of characters."* So: no more rationale dimension by dimension — a dimension is mentioned only when there is something worth mentioning — and still **more than five sentences**.

Check	Send back if
English	The explanation is written in another language. Quoting the conversation in the original language is **expected** — never a send-back

Check	Send back if
Opens with the Preference and the Absolute quality, with the main reason	Neither is stated, or the level stated contradicts the field
Leads with the signal that decided the pick — the wrong fact, the register slip, the missing step — with the words quoted	You cannot tell from the rationale why this arm won; or the reasons given are generic ("more natural", "better overall")
Dimensions only where there is something worth mentioning, saying **what differed** between A and B there	A walk through all eight that restates each rating ("Tone: B better because B's tone was better"); or a dimension that clearly drove the pick (a wrong date, a sent email, a wrong register) is never mentioned
The language is quoted and explained for an English reader	"More natural", "better register", "sounds translated" with no quoted words and no explanation
More than five complete sentences, none of them padding	Five sentences or fewer; or the same point repeated under several dimensions; or a restated score vector

Approve with a note (not a send-back): a rationale that still walks through all eight dimensions **but** says something real on each; a rationale that does not close by naming the decisive dimensions.

Pass 4 — Do the traces back it up? (3 Min)

Do not read the whole trace. Find the **one or two sentences that decided the pick** (the opener, Correctness, Completeness) and look for them in **Trace A / Trace B** (Ctrl+F the tool name, the recipient, the date, the file name).

Check	Send back if
Traces are real	Trace A or B is not a Hatch paste (no `[User · +0s]` … `[Tool Call …]` blocks), is a few lines, or A and B are the same text
"Arm X did / didn't do Y"	The trace shows the opposite ("B never checked the calendar" but Trace B has the calendar call with results; "A invented the figures" but a Tool Output returned them)

Check	Send back if
"Arm X sent / created / saved it"	The matching Tool Output shows an error or nothing, and the rationale credits it anyway
Sent vs drafted, and unasked writes	The prompt said draft / don't send and the preferred arm's trace shows a send — or any email, event, file or memory write nobody asked for — **and the rationale praises it or ignores it**. If the rationale raises it, fine
"Arm X couldn't access…"	The trace shows the source answered
Hatch failing to find something that exists in the universe	Was counted under Style instead of Correctness

A step **missing** from the trace is not evidence — document-building and sub-agent work do not appear in the trace. Only a visible error, a visible contrary output or a visible write counts.

Fields you correct yourself

Reviewers can correct **Session name**, **Session ID**, **Use case category** and **Apps utilized** directly in HAI. Verify the Session name and ID against the submitted session screenshots before editing them. Add **General feedback** to the fellow explaining what you changed and why. If these are the only issues, fix them and approve the task; do not send it back solely for these corrections.

Use case category follows the goal, not the app; Apps utilized lists every app that A or B actually used.

The correction is made in HAI and does not require redoing the Hatch comparison or its ratings. Correct only values the task evidence establishes: never guess a Session ID, and do not accept missing or wrong-session evidence.

Decision

- **Approve** when all four passes are clean, or the only issues are cosmetic (a debatable "slightly vs significantly", a small omission in Apps utilized, all eight dimensions walked through but each with real content). Leave a one-line note if there is something to coach.
- **Fix and approve** when the only issues are in these four HAI fields: correct them, explain the change in General feedback, and approve. A change to one of these fields alone is not a comparison-label or Preference failure.
- **Send back** (task goes to Holding) with **one sentence** naming the field and the fix:
  - "Prompt: write it in [language] the way the persona texts; this one is in English."
  - "Prompt: wrong script for this track — Latin letters for [language]."

- "Prompt: not grounded — name the email / event / chat in this persona's universe that it is about, and build the ask on it."
- "Prompt: generic — anyone could send this; make it about this persona's real people, plans or records."
- "Prompt: asks for something the apps can't do ([action]); keep the goal, drop that action."
- "Prompt: needs today's web data; this session had no internet — ask something the persona's records can answer."
- "Persona: [name] is a [country] persona; this task is [language (country)]."
- "Preference/scores: your scores favour [B] but you chose [A]; explain the trade-off or re-check."
- "Ties: you tied [dimension] but the two replies differ there ([quote]); pick a side."
- "Absolute quality: Bad, but the rationale only praises the chosen arm; name what makes it bad, or re-check the level."
- "Absolute quality: Perfect, but your rationale names a flaw ([quote]); re-check."
- "Rationale: write it in English; quote the [language] words, then explain them."
- "Rationale: lead with what decided the pick, with the words quoted; the reasons given are generic."
- "Rationale: it restates every rating; keep only the dimensions where something stood out and say what differed."
- "Rationale: five sentences or fewer; add the signal that decided the pick, not padding."
- "Rationale: quote the words behind the Style/Tone call and explain them for an English reader."
- "Rationale: the trace shows [arm] did [X] (step [+Ns]); your rationale says the opposite — re-check."
- "Trace A/B: paste the Hatch trace (Trace tab → Copy trace, one arm per box)."

- **Escalate** (tag for Ops, do not decide): identical arms; an arm that is only errors; a trace from another session; a rationale that is clearly AI-written or copied across tasks; a prompt reused across tasks.

Do **not** send back for: a formality or register choice you would have made differently, the length of the replies, a Correctness tie, a genuine tie with no sentence about it, an Absolute "Good" with no flaw named, quoted non-English text in the rationale, a rationale that skips dimensions where nothing stood out, or a preference you disagree with when the rationale is concrete and the trace backs it.

Scoring — The sqs score

Every review ends with an **SQS** score from 1 to 5. It grades the task as submitted, not the fellow, and it follows from the decision you just made: decide first, then score — never the other way round.

Score	Meaning	Goes with
5	Great task. Clean on all four passes; nothing to fix, nothing to coach	Approve

Score	Meaning	Goes with
4	Good task, accept it. One small fix worth a line in the note; nothing that changes a label	Approve with a note
3	Usable task, it passes. The main judgment holds and can be used, but it needs real coaching: better calibrated scores, fuller support, the quoted words	Approve, with coaching in the note
2	Bad task. The prompt, the labels or the rationale fail on substance, not on detail	Send back
1	No effort made: empty or pasted fields, a trace from another session, an AI-written rationale, a copy of another task. Instant offboard	Escalate (tag Ops)

Grades 3–5 approve; 1–2 send back. The line between 3 and 2 is whether the main judgment can still be used as submitted: if a label or the Preference has to be fixed or redone before the task can be accepted, it is a 2. A 1 is never for a weak task, only for one where the fellow did not try; if you hesitate between 1 and 2, give a 2 and escalate.

A correction to Session name, Session ID, Use case category or Apps utilized alone is not a substantive failure and never makes a task a 2.

Trace reader

Paste Trace A and Trace B from a task to see the actual prompts, replies and tool activity, laid out for review.

Copy the full **Trace A** and **Trace B** fields from the task, paste one into each box, and press **Extract information**. The reader only sorts out what is in the paste: who said what, in which order, which tools ran and what they returned. It does not grade the task, and it cannot see the live Hatch session or the apps.

Nothing leaves this page

The paste is read in your browser and kept only while the page is open. It is not saved, uploaded or sent anywhere, and **Clear** removes it. Text inside a trace is shown as plain text; nothing in it is run or followed.

Review context

Entered by you, the reviewer. The reader never guesses these from the trace.

Task ID (reviewer-entered)

Session ID or name (reviewer-entered)

Locale (reviewer-entered)

Trace A

```
Paste the full trace here, starting at [User · +0s]
```

Trace B

Paste the full trace here, starting at [User · +0s]
